This XPS Programmer's Manual describes all the functions available for the XPS family of controllers.

**NOTE**

Not all below described functions are available for XPS standard controller. If you are interested in a function that is described but not available for your controller, please contact Newport.

**NOTE**

For more details on XPS features, please refer to XPS User’s Manual.
2.0 TCP/IP Communication

XPS is based on a 10/100/1000 Base-T Ethernet communication link with TCP/IP protocol and uses a website as the Graphical User Interface (GUI) to access all the software tools and an FTP server for file transfer. This makes the XPS controller independent of the user's operating system. When networked, Unix, Linux or Windows users can access the same controller from any place in the world for remote control, code development, file transfer or diagnostics. The completely object-oriented approach of the XPS firmware with powerful, multi-parameter Functions (commands) is also much more consistent and intuitive to use than old-style mnemonic commands.

To connect to the XPS controller you must open a socket. The XPS allows up to 100 open sockets with 30 sockets communicating simultaneously.

Each Function returns a complete or error code. If successful, the return is 0 (zero). In case of an error, the returned error code can be used for diagnosing the.

The function call is blocked until a reply is sent by the XPS, or until the timeout value is reached. Running several processes in parallel (for instance getting the position while a stage is moving), several sockets can be used in parallel. When using the XPS controller with programming languages that do not support multiple sockets, the timeout value of the function can be set to a low value (20 ms), in that case you cannot capture errors.

NOTE

When a communication ends with a timeout fault, it could be caused by some hardware failure or the timeout value is lower than the time needed by the controller to execute the requested function.

For example, setting a timeout of one second and requesting a motion that requires 2 seconds will end with a timeout. In this situation the controller will continue the move and when accomplished will send the response back to the host.

It is the host responsibility to take the appropriate actions to handle properly these situations.
3.0 XPS .NET Software Drivers

3.1 How to Install .NET Drivers for XPS Controller

3.1.1 Requirements

.Net Framework is a programming infrastructure created by Microsoft for building, deploying, and running applications and services that use .NET technologies such as custom desktop applications.

The Windows PC computer requires having at least the .NET Framework installed and you need to install either 32 bit (x86) or 64 bit (x64) .NET assembly depending on the Windows version you are using.

When developing your application, refer to the programming environment documentation to make the installed .NET assembly visible.

To communicate with the XPS controller you will need to:

- Use the OpenInstrument method to connect to the controller
- Communicate with the controller using any of its API e.g. FirmwareVersionGet
- Once your application terminates it needs to disconnect from the controller using the CloseInstrument method. If it doesn’t close the communication channel and runs many connections to the controller, it can run out of free channels and gets an error.
3.1.2 Installation

The .NET assembly is in the website under tab Documentation -> Drivers “, refer to the controller user’s manual for more details.

Download the “Newport.XPS.CommandInterface_x86.msi” or “Newport.XPS.CommandInterface_x64.msi” depending on your windows platform to your computer.

Once downloaded, run it.

Click on next to continue the install.
Select the folder to install a csharp project example and documentation. Click on next to continue the install.

![Confirm Installation]

Click on next to continue the install.

![Installing]

Wait until the installation is complete.

![Installation Complete]

The installation is complete. Click on close.

The x86 “Newport.XPS.CommandInterface.dll” is installed in C:\Windows\Microsoft.NET\assembly\GAC_32\Newport.XPS.CommandInterface. The x64 “Newport.XPS.CommandInterface.dll” is installed in C:\Windows\Microsoft.NET\assembly\GAC_64\Newport.XPS.CommandInterface.
3.2 Variables Equivalent for Programming Languages

The table below describes a simple prototype model for different languages:

<table>
<thead>
<tr>
<th>Prototype</th>
<th>C++ FunctionName (double inputParam, double * outputParam)</th>
</tr>
</thead>
<tbody>
<tr>
<td>C++</td>
<td>int FunctionName(int SocketID, double inputParam, double * outputParam)</td>
</tr>
<tr>
<td>VBasic</td>
<td>Long FunctionName(ByVal SocketID As Long, ByVal inputParam As Double, outputParam As Double)</td>
</tr>
<tr>
<td>Matlab</td>
<td>[Error, outputParam] FunctionName(int32 SocketID, double inputParam)</td>
</tr>
<tr>
<td>Python</td>
<td>[Error, outputParam] FunctionName(integer SocketID, double inputParam)</td>
</tr>
<tr>
<td>TCL</td>
<td>set Error [catch &quot;FunctionName SocketID inputParam outputParam &quot;]</td>

3.3 How to Use XPS .NET Assembly from Visual Studio C#?
Refer to Microsoft for more information on how to load and use a .NET assembly depending on your Visual Studio version.

3.3.1 Add Reference to Newport XPS .NET Assembly
In your project add Newport.XPS.CommandInterface.dll in References from Windows GAC:

3.3.2 C# Code Sources

C# Header
using CommandInterfaceXPS; // Newport.XPS.CommandInterface .NET Assembly

Add a Variable to Declare an “XPS” Object
CommandInterfaceXPS.XPS m_xpsInterface = null;

Create an Instance of “XPS” Object
m_xpsInterface = new CommandInterfaceXPS.XPS();
if (m_xpsInterface != null) ...

Open XPS Connection
if (m_xpsInterface != null)
int returnValue = m_xpsInterface.OpenInstrument(mIPAddress, m IPPort, DEFAULT_TIMEOUT);

Call “XPS” Functions
if (m_xpsInterface != null)
{
    string XPSVersion = string.Empty;
    string errorString = string.Empty;
    int result = m_xpsInterface.FirmwareVersionGet(out XPSVersion, out errorString);
    if (result == CommandInterfaceXPS.XPS.FAILURE)
 ...

Close XPS Connection
if (m_xpsInterface != null)
    m_xpsInterface.CloseInstrument();

3.4 How to Use XPS .NET Assembly from LabVIEW?
Refer to LabVIEW for more information on how to load and use a .NET assembly depending on your LabVIEW version.
3.4.1 Add Reference to .NET Assembly

Select **CommandInterfaceXPS** and **XPS constructor** from a **.Net Constructor Node** (refer to Connectivity panel):

![Select .NET Constructor](image)

3.4.2 LabVIEW Code Sources

The instance of “XPS” object is created after configuration of **.Net Constructor Node**:

```
> Connectivity > .NET >
.Net Constructor Node
```

Open XPS connection (Use a **.Net Invoke Node** to select the XPS method “OpenInstrument”):

```
.Net Invoke Node
```

![Net Invoke Node](image)
Call “XPS” functions (Use a .Net Invoke Node to select a XPS method):

![Image of .Net Invoke Node]

Close XPS connection (Use a .Net Invoke Node to select the XPS method “CloseInstrument”):

![Image of .Net Invoke Node]

Close .NET Reference:

![Image of Close .Net Reference]

3.5 How to Use XPS .NET Assembly from IronPython?
Refer to IronPython for more information on how to load and use a .NET assembly depending on your IronPython version.

3.5.1 Add Reference to .NET Assembly
Add Newport.XPS.CommandInterface.dll in References of your script:

x86:
```python
import sys
sys.path.append(r'C:\Windows\Microsoft.NET\assembly\GAC_32\Newport.XPS.CommandInterface\v4.0.1.0.0.0.0__9a267756cf640dcf')
```

x64:
```python
import sys
sys.path.append(r'C:\Windows\Microsoft.NET\assembly\GAC_64\Newport.XPS.CommandInterface\v4.0.1.0.0.0.0__9a267756cf640dcf')
```

3.5.2 IronPython Code Source

IronPython Header
```python
# The CLR module provide functions for interacting with the underlying .NET runtime
import clr
# Add reference to assembly and import names from namespace (IronPython)
clr.AddReferenceToFile("Newport.XPS.CommandInterface.dll") from CommandInterfaceXPS import *
```

Create an Instance
```python
# Create XPS interface myXPS = XPS()
```
Open XPS Connection
def XPS_Open(address, port):
    # Create XPS interface
    myXPS = XPS()
    # Open a socket
    timeout = 1000
    result = myXPS.OpenInstrument(address, port, timeout)
    if result == 0:
        print 'Open ', address, "":"", port, " => Successful"
    else:
        print 'Open ', address, "":"", port, " => failure ", result
    return myXPS

Call XPS Functions
def XPS_GetControllerVersion(myXPS, flag):
    result, version, errString = myXPS.FirmwareVersionGet()
    if flag == 1:
        if result == 0:
            print 'XPS firmware version => ', version
        else:
            print 'FirmwareVersionGet Error => ', errString
        return result, version
    def XPS_GetControllerState(myXPS, flag):
        result, state, errString = myXPS.ControllerStatusGet()
        if flag == 1:
            if result == 0:
                print 'XPS controller state => ', state
            else:
                print 'ControllerStatusGet Error => ', errString
            return result, state

Close XPS Connection
def XPS_Close(myXPS):
    myXPS.CloseInstrument()
3.6 How to Use XPS .NET Assembly from Matlab?
Refer to Matlab for more information on how to load and use a .NET assembly depending on your Matlab version.

3.6.1 Add Reference to .NET Assembly
% Make the assembly visible from Matlab
asmInfo = NET.addAssembly('Newport.XPS.CommandInterface')

3.6.2 Matlab Code Source

Create an Instance
% Make the instantiation
myxps=CommandInterfaceXPS.XPS();

Open XPS Connection
% Connect to the XPS controller
code=myxps.OpenInstrument('192.168.254.254',5001,1000);

Call XPS Functions
% Use API's
[code]=myxps.GroupInitialize('Group1')
[code]=myxps.GroupHomeSearch('Group1')

Close XPS Connection
% Disconnect from the XPS controller
code=myxps.CloseInstrument;

3.7 How to Use XPS .NET Assembly from Python?
Refer to Python and Pythonnet for more information on how to load and use a .NET assembly depending on your Python version.

3.7.1 Install pythonnet
Install pythonnet using pip package manager:

```
pip install pythonnet
```

3.7.2 Add Reference to .NET Assembly
Add Newport.XPS.CommandInterface.dll in References of your script:

```
x86:
import sys
clr.AddReference(r'C:\Windows\Microsoft.NET\assembly\GAC_32\Newport.XPS.CommandInterface\v4.0_1.0.0.0__9a267756cf640dcf')
```

```
x64:
import sys
clr.AddReference(r'C:\Windows\Microsoft.NET\assembly\GAC_64\Newport.XPS.CommandInterface\v4.0_1.0.0.0__9a267756cf640dcf')
```

3.7.3 Python Code Source
**Python Header**

```python
import sys
# The CLR module provide functions for interacting with the underlying .NET runtime
import clr
# Add reference to assembly and import names from namespace (IronPython)
clr.AddReferenceToFile("Newport.XPS.CommandInterface.dll") from CommandInterfaceXPS import *
```

**Create an Instance**

```python
# Create XPS interface
myXPS = XPS()
```

**Open XPS Connection**

```python
def XPS_Open (address, port):
    # Create XPS interface
    myXPS = XPS()
    # Open a socket
timeout = 1000
result = myXPS.OpenInstrument(address, port, timeout)
if result == 0:
    print('Open ', address, ":", port, " => Successful")
else:
    print('Open ', address, ":", port, " => failure ", result)
return myXPS
```

**Call XPS Functions**

```python
def XPS_GetControllerVersion (myXPS, flag):
    result, version, errString = myXPS.FirmwareVersionGet("","")
    if flag == 1:
        if result == 0:
            print('XPS firmware version => ', version)
        else:
            print('FirmwareVersionGet Error => ', errString)
    return result, version
```

**Close XPS Connection**

```python
def XPS_Close(myXPS):
    myXPS.CloseInstrument()
```
4.0 TCP/IP Support Functions

To ease the use of the TCP/IP communication, few functions have been develop by Newport. These functions uses the Microsoft System.Net.Sockets.

4.1 OpenInstrument

Name
OpenInstrument – Create and open a socket.

Description
This function is used to create and open a socket. Send Timeout is set to 1 second.

Prototype
int OpenInstrument (string IP_Address, int Port, int ReceiveTimeout)

Input parameters
- IP_Address: string, IP address of instrument.
- Port: int, Port number.
- Timeout: int, ReceiveTimeout in milliseconds.

Output parameters
None.

Return
- 0: No error.
- -1: Error of socket open.
4.2 CloseInstrument

Name
CloseInstrument – Closes the current socket.

Description
This function is used to close the current socket.

Prototype
int CloseInstrument ()

Input parameters
None.

Output parameters
None.

Return
• 0: No error.
• -1: Error of socket close.

4.3 SetTimeout

Name
SetTimeout – Configures socket timeout.

Description
This function is used to configure socket timeout for sending and reading.

Prototype
int SetTimeout (int SendingTimeout, int ReadingTimeout)

Input parameters
SendingTimeout  int  Sending timeout in milliseconds.
ReadingTimeout  int  Reading timeout in milliseconds.

Output parameters
None.

Return
• 0: No error.
• -1: Error of set timeout.
5.0 XPS Standard Firmware Architecture (Base Version)

5.1 Group Definition

The “Group” objects are used to define one or several “positioners” in the same motion group. The available motion groups are defined in the section [GROUPS] in the system.ini file and the group types are:

- SingleAxis (1 positioner)/“Gantry” SingleAxis (2 positioners)
- SingleAxisWithClamping (1 positioner)
- SingleAxisTheta (1 positioner)
- Spindle (1 positioner)
- XY (2 positioners)/“Gantry” XY (3 or 4 positioners)
- XYZ (3 positioners)
- Hexapod (6 positioners)
- MultipleAxes/“Gantry” MultipleAxes (1 to 8 positioners)
- TZ (3 positioners)

5.1.1 Object Structure

A motion “Group” is created in relation to a group type (SingleAxis, SingleAxisWithClamping, SingleAxisTheta, Spindle, XY, XYZ, TZ, Hexapod or MultipleAxes).

A group is defined by a group name.

NOTE

The maximum number of positioners in the same group is limited to 8.
5.2 **Positioner Definition**

Positioner objects are used to define all motion specific configuration parameters. The positioner includes a mapping correction: $X = f(X)$

The positioner includes the SGamma profile.

The maximum number of positioners is limited to ControllerAxesNumber (4, 8, 12 or 16, depending on type of the XPS controller hardware).

5.2.1 **Object Structure**

To use a positioner, it must belong to a motion group. Positioners are defined by their **full positioner name**. The full positioner name is composed of the group name and the positioner name separated by a character “.”.

**Example:**

GroupName.PositionerName or
3-Axis system.X-axis
5.2.2 Definition of the Positions Available for Each Positioner

For each positioner, three different positions can be called:

1. The **SetpointPosition** is the profiler position. This is the position where the positioner should be according to the ideal theoretical motion profile.

2. The **CurrentPosition** is the encoder position of the stage after mapping corrections are applied. This is the actual position of the positioner at this moment of the query.

3. The **TargetPosition** is the final target position commanded by the user.

The difference between the SetpointPosition and the CurrentPosition is called the following error.

For example, during a motion from the position 0 (units) to 100 (units), a query in the middle of the motion could have the following result:

SetpointPosition = 50

CurrentPosition = 49.998 (FollowingError = 50 – 49.998 = 0.002 unit)

TargetPosition = 100.
5.3 SingleAxis Group

The SingleAxis group is composed of one single positioner for the execution of motion commands.

A SingleAxis group can be used in GANTRY mode (dual positioner).

The XPS controller can handle several SingleAxis objects.

There is no relation between SingleAxis objects and other objects handled by the controller.
5.3.1 State Diagram

Called functions:

(a) GroupInitialize
(b) GroupHomeSearch
(c) GroupMoveAbsolute
(d) GroupMoveRelative
(e) GroupSlaveModeEnable
(f) GroupMotionDisable
(g) GroupMotionEnable
(h) GroupMoveAbort
(i) GroupKill or KillAll
(j) GroupJogModeEnable
(k) GroupJogModeDisable

(l) GroupAnalogTrackingModeEnable
(m) GroupAnalogTrackingModeDisable
(n) GroupInitializeWithEncoderCalibration
(o) GroupReferencingStart
(p) GroupReferencingStop
(q) PositionerAccelerationAutoScaling
(r) PositionerCorrectorAutoTuning
(s) PositionerExcitationSignalSet / PositionerPreCorrectorExcitationSignalSet
(t) GroupSlaveModeDisable
(u) GroupInitializeNoEncoderReset
5.4 Spindle Group

A Spindle group is very similar to the SingleAxis group. It is composed of only one positioner with one main difference, it does not handle software or hardware end of runs. Therefore, it is allowed to spin indefinitely in any direction. The SingleAxis group motion commands are still allowed (except jog, which is replaced by spin).

The controller can handle several Spindle groups.

There is no relation between Spindle groups and other objects handled by the controller.
5.4.1 State Diagram

Called functions:

(a) GroupInitialize  
(b) GroupHomeSearch  
(c) GroupMoveAbsolute  
(d) GroupMoveRelative  
(e) GroupSlaveModeEnable  

(l) GroupAnalogTrackingModeEnable  
(m) GroupAnalogTrackingModeDisable  
(n) GroupInitializeWithEncoderCalibration  
(o) GroupReferencingStart  
(p) GroupReferencingStop  
(q) PositionerAccelerationAutoScaling  
(r) PositionerCorrectorAutoTuning  
(s) PositionerExcitationSignalSet / PositionerPreCorrectorExcitationSignalSet  
(t) GroupSlaveModeDisable  
(u) GroupInitializeNoEncoderReset
5.5 **XY Group**

An XY group is composed of two positioners, typically in an orthogonal XY configuration.

An XY group can be used in GANTRY mode (dual positioner for X or for Y).

It includes an XY mapping feature: \( XY = f(XY) \)

It includes a line-arc and a PVT (PositionVelocityTime) two-dimension trajectories.
5.5.1 State Diagram

Called functions:

(a) GroupInitialize
(b) GroupHomeSearch
(c) GroupMoveAbsolute/…Relative
(d) MoveSlice
(e) XYLineArcExecution
(f) GroupMotionDisable
(g) GroupMotionEnable
(h) GroupMoveAbort
(i) GroupKill or KillAll
(j) GroupJogModeEnable
(k) GroupJogModeDisable

(o) GroupReferencingStart
(p) GroupReferencingStop
(q) PositionerAccelerationAutoScaling
(r) PositionerCorrectorAutoTuning
(s) PositionerExcitationSignalSet / PositionerPreCorrectorExcitationSignalSet
(t) GroupInitializeNoEncoderReset
5.6 **XYZ Group**

An XYZ group is a three positioner object, typically in an orthogonal XYZ configuration.

It includes an XYZ mapping feature: \( \text{XYZ} = f(\text{XYZ}) \)

It also includes 3D spline trajectories.

![Diagram of XYZ Group Positioner](image-url)
5.6.1  State Diagram

Called functions:

(a)  GroupInitialize  (k)  GroupJogModeDisable
(b)  GroupHomeSearch  (l)  GroupAnalogTrackingModeEnable
(c)  GroupMoveAbsolute  (m)  GroupAnalogTrackingModeDisable
(d)  GroupMoveRelative  (n)  GroupInitializeWithEncoderCalibration
(e)  XYZSplineExecution  (o)  GroupReferencingStart

(i)  GroupKill or KillAll  (s)  PositionerExcitationSignalSet
(j)  GroupJogModeEnable  (t)  GroupInitializeNoEncoderReset
5.7 MultipleAxes Group

A MultipleAxes group is an n-positioner object, where n can be any number from 1 to 8.

A MultipleAxes group can be used in GANTRY mode (dual positioner for one or several positioners).

It includes the PVT (PositionVelocityTime) and PT (PositionTime) trajectories.
5.7.1 State Diagram

Called functions:

(a) GroupInitialize  (k) GroupJogModeDisable
(b) GroupHomeSearch  (l) GroupAnalogTrackingModeEnable
(c) GroupMoveAbsolute  (m) GroupAnalogTrackingModeDisable
(d) GroupMoveRelative  (n) GroupInitializeWithEncoderCalibration

5.8 Hexapod Group (Contact Newport)

NOTE
Contact Newport to obtain an HXP-D controller that manages an Hexapod group with the following features.

5.8.1 Definition of hexapod coordinate systems

- **Work** is defined in **WORLD**
- **Base** is defined in **WORLD**
- **Tool** is defined in **CARRIAGE**

5.8.2 Hexapod group real system (Legs)
The real system allows to move each positioner “legs” (1,2,3,4,5,6) in the real coordinate (units).

5.8.3 Hexapod coordinate system
The hexapod system allows to move all positioners in the hexapod coordinate (X,Y,Z,U,V,W) **Tool** in **Work**.

X,Y,Z (units) and U,V,W (degrees) with

- U being the rotation around axis X
- V being the rotation around axis Y
- W being the rotation around axis Z
5.8.4 Hexapod group

A Hexapod is a motion device with 6 degrees of freedom. The Hexapod Group is composed of six positioners (legs) that allows execution of motion commands.

5.8.4.1 State Diagram

Called function:
(a) GroupInitialize
(b) GroupHomeSearch
(c) GroupMoveAbsolute
   GroupMoveRelative
(d) HexapodMoveAbsolute
   HexapodMoveIncremental
   HexapodMoveIncrementalControl
   HexapodMoveIncrementalControlWithTargetVelocity
(e) GroupInitializeWithEncoderCalibration
(f) GroupMotionDisable
(g) GroupMotionEnable
(h) GroupMoveAbort
(i) GroupKill or KillAll
5.9  Analog and Digital I/O

5.9.1  GPIO Name List

5.9.1.1  XPS-Q Hardware

**Digital inputs**
- GPIO1.DI  Digital Input of the I/O board connector #1 (8 bits)
- GPIO2.DI  Digital Input of the I/O board connector #2 (6 bits)
- GPIO3.DI  Digital Input of the I/O board connector #3 (6 bits)
- GPIO4.DI  Digital Input of the I/O board connector #4 (16 bits)

**Digital outputs**

6.0  XPS Extended Firmware Architecture (Contact Newport)

NOTE
Contact Newport to obtain the extended firmware version that includes the following features.

6.1  SingleAxisWithClamping Group
The SingleAxisWithClamping Group is composed of one single positioner that allows execution of motion commands.

In general, it is similar to SingleAxis group, the only difference is the support of clamping: axis is clamped before moves, unclamped during moves and reclamped at stop. This enhances the stability at a position.

A SingleAxisWithClamping group CANNOT be used in GANTRY mode (secondary positioner is impossible).

The XPS controller can handle several SingleAxisWithClamping objects.
6.1.1 State Diagram

Called functions:

(a) GroupInitialize  (k) GroupJogModeDisable
(b) GroupHomeSearch  (l) GroupAnalogTrackingModeEnable
(c) GroupMoveAbsolute  (m) GroupAnalogTrackingModeDisable
(d) GroupMoveRelative  (n) GroupInitializeWithEncoderCalibration
(f) GroupMotionDisable  (o) GroupReferencingStart
(g) GroupMotionEnable  (p) GroupReferencingStop
(h) GroupMoveAbort  (q) PositionerAccelerationAutoScaling
(i) GroupKill or KillAll  (r) GroupInitializeNoEncoderReset
(j) GroupJogModeEnable
6.1.2  Group Clamping Sequence

6.1.2.1  Clamping State Diagram

**NOTES**

In case of recoverable errors (go to DISABLE state or go to READY state), the clamp is unclamped.

In case of fatal errors (go to NOT INIT state), the clamp stays in the current state (clamped).
6.2 SingleAxisTheta Group

The SingleAxisTheta is composed of one single positioner object with three encoders (Theta encoder) for the execution of motion commands. It includes a “Yaw” mapping and a “Theta” correction on an XY group.

A SingleAxisTheta group CANNOT be used in GANTRY mode (secondary positioner is impossible).
6.2.1 State Diagram

Called functions:

(a) GroupInitialize
(b) GroupHomeSearch
(c) GroupMoveAbsolute
(d) GroupMoveRelative
(e) GroupSlaveModeEnable
(f) GroupMotionDisable
(g) GroupMotionEnable
(h) GroupMoveAbort

(m) GroupAnalogTrackingModeDisable
(n) GroupInitializeWithEncoderCalibration
(o) GroupReferencingStart
(p) GroupReferencingStop
(q) PositionerAccelerationAutoScaling
(r) PositionerCorrectorAutoTuning
(s) PositionerExcitationSignalSet / PositionerPreCorrectorExcitationSignalSet
(t) GroupSlaveModeDisable
(u) GroupInitializeNoEncoderReset
6.2.2 Group Clamping Sequence

6.2.2.1 Clamping State Diagram

**NOTES**

In case of recoverable errors (go to DISABLE state or go to READY state), the clamp is unclamped.

In case of fatal errors (go to NOT INIT state), the clamp stays in the current state (clamped).
6.3 TZ Group

A TZ group is a 3-positioner object, like the XYZ group, but with the following differences:

- It supports the PVT trajectories.
- It does not support 3D spline trajectories.
- It supports TZDecoupling, XYtoZZZAccelerationFeedforward and TZTracking functionalities.
- It supports Focus process via the XPS focus interface board and focus process module (focus.out).
- It has a specific way of initialization

\[(MotorDriverInterface = AnalogAccelerationTZ).\]
6.3.1 State Diagram

Called functions:

(a) GroupInitialize  (l) GroupAnalogTrackingModeEnable
(b) GroupHomeSearch   (m) GroupAnalogTrackingModeDisable
(c) GroupMoveAbsolute (n) GroupInitializeWithEncoderCalibration
(d) GroupMoveRelative (o) GroupReferencingStart
(e) MultipleAxesPVTExecution (p) GroupReferencingStop
(f) GroupMotionDisable (q) PositionerAccelerationAutoScaling
(g) GroupMotionEnable (r) PositionerCorrectorAutoTuning
(h) GroupMoveAbort (s) PositionerExcitationSignalSet
(i) GroupKill or KillAll (t) TZFocusModeEnable
(j) GroupJogModeEnable (u) GroupInitializeNoEncoderReset
(k) GroupJogModeDisable
6.4 Mask Group

Mask object defines a clamper drive with real time state monitoring.

6.4.1 State Diagram

functions:

(a) GroupInitialize
(b) MaskClampEnable
(c) MaskClampDisable
6.5 User External Module Programming

The user external module programming manages the written by user program blocks (ExternalModules) in the XPS controller, with the following conditions:

- Every user external module is written in C language (GNU with QNX Momentics IDE).
- The user ExternalModule (*.so) must be stored in the “/Admin/ UserOptionalModules /” in the XPS controller.
- Every user external module is loaded and executed at boot in adding the external module name in the SharedLibraryModuleNames line of the [GENERAL] section of system.ref file.

```
system.ref:
[GENERAL]
[...]
SharedLibraryModuleNames = ExternalModule1, ExternalModule2
[...]
```
6.6 ZYGO Interferometer

6.6.3 Status, Error, and High Nibble P2 Interface Register

This register contains the status bits, error bits, and the 4 high order position data bits. The table below lists the bit positions of these signals in the register. See “Error Detection and Status Reporting” section for more information. The bits that correspond to fatal errors are indicated by “(F)”.  

Table 3-4 Status, Error, and High Nibble P2 Interface Register Bit Positions

<table>
<thead>

<tr>
<td>30</td>
<td>(F) 36 bit Position Overflow</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>32 bit Position Overflow</td>
<td></td>
</tr>
</tbody>
</table>

The high nibble bits are latched at the same time as the P2 Position register, and should be read after the position is read. The error bits (21-31) have the same meaning as the corresponding errors in the VME Error Status register (bits 0-10). The P2 Error register is set and reset separately from the VME Error Status register.

The status bits (16-20) have the same meaning as the corresponding status bits in the VME Status Register (bits 0-4). The User Bit shows the state of the User P2 bit in VME Control Register 1.

</tbody>
</table>

The axis status register is read via Ethernet.
7.0 XPS Functions Description

7.1 Input Tests Common to all XPS Functions

For all commands, general input tests are the following:

**General:**
-20 Controller initialization failed.
-21 XPS initialization in progress.

**Check the command format:**
-7 Wrong format in the command string.

**Check the number of parameters:**
-9 Wrong number of parameters in the command.

**Check input/output parameter type:**
-10 Wrong parameter type in the command string.
-11 Wrong parameters type in the command string: word or word * expected.
-12 Wrong parameter type in the command string: bool or bool * expected.
-13 Wrong parameter type in the command string: char * expected.
-14 Wrong parameter type in the command string: double or double * expected.
-15 Wrong parameter type in the command string: int or int * expected.
-16 Wrong parameter (value < 0) or wrong type in the command string: unsigned int or unsigned int * expected.
-128 Wrong parameter (value < 0) or wrong type in the command string: unsigned short or unsigned short * expected.
-129 Wrong parameter (value < 0) or wrong type in the command string: unsigned long or unsigned long * expected.
-132 Wrong parameter (value < 0) or wrong type in the command string: unsigned long long or unsigned long long * expected.
7.2 XPS Functions Lists

7.2.1 Standard Functions

7.2.1.1 CleanCoreDumpFolder

Name
CleanCoreDumpFolder – Cleans the folder “/Admin/Public/CoreDump” to delete all debug core dump (*.core) files.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if “/Admin/Public/CoreDump” exists: (-22)
- Checks error code returned by shell system command: (-100)

Description
This function cleans the “/Admin/Public/CoreDump” folder to delete all core files and to free memory.

Prototype
int CleanCoreDumpFolder(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -22: Not allowed action.
- -100: Internal error.
7.2.1.2 CleanTmpFolder

Name

CleanTmpFolder – Cleans the folder “tmp” to delete all temporary files.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks error code returned by shell system command: (-100)

Description

This function cleans the “tmp” folder to delete all temporary files.

Prototype

int CleanTmpFolder(int SocketID)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -100: Internal error.
7.2.1.3 **CloseAllOtherSockets**

**Name**

`CloseAllOtherSockets` – Closes all sockets beside the one used.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks “Administrator” rights: (-107)

**Description**

This function allows an administrator to close all user sockets except the socket used to call this function. All other user sockets are closed. So, ERR_SOCKET_CLOSED_BY_ADMIN error is sent to each running (on an user socket) process before the socket is really closed.

**Prototype**

```c
int CloseAllOtherSockets()
```

**Input parameters**

None.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -107: This function requires Administrator rights.

---

**NOTE**

Call the “Login” function to identify the user as “Administrator”.

---

**CAUTION**

If some TCL scripts are in progress (after a “TCLScriptExecute” function or a “TCLScriptExecuteAndWait” function), do not use `CloseAllOtherSockets` to function to kill these TCL scripts. Use the “TCLScriptKill” function to stop the TCL execution and only after can you use the “CloseAllOtherSockets” function to close sockets.
7.2.1.4 ControllerMotionKernelTimeLoadGet

**Name**

ControllerMotionKernelTimeLoadGet – Gets controller motion kernel time load.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function gets the last exact value of the controller’s motion kernel time load (total, corrector, profiler and servitudes calculation time).

\[
\text{CorrectorTimeLoad} = \frac{\text{CorrectorCalculationTime}}{\text{CorrectorISRPeriod}} \\
\text{ProfilerTimeLoad} = \frac{\text{ProfilerCalculationTime}}{\text{CorrectorISRPeriod}} \times \frac{1}{\text{ProfileGeneratorISRRatio}} \\
\text{ServitudesTimeLoad} = \frac{\text{ServitudesCalculationTime}}{\text{CorrectorISRPeriod}} \times \frac{1}{\text{ServitudesISRRatio}} \\
\text{TotalTimeLoad} = \text{CorrectorTimeLoad} + \text{ProfilerTimeLoad} + \text{ServitudesTimeLoad}
\]

**NOTE**

Refer to system.ref file to get CorrectorISRPeriod, ProfileGeneratorISRRatio and ServitudesISRRatio.

**Prototype**

```c
int ControllerMotionKernelTimeLoadGet(
    int SocketID,
    double * CPUTotalLoadRatio,
    double * CPUCorrectorLoadRatio,
    double * CPUProfilerLoadRatio,
    double * CPUServitudesLoadRatio
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier used in each function.

**Output parameters**

- **CPU>TotalLoadRatio**
  - double *
  - Controller motion kernel total CPU time load.
- **CPU>CorrectorLoadRatio**
  - double *
  - Controller motion kernel corrector CPU time load.
- **CPU>ProfilerLoadRatio**
  - double *
  - Controller motion kernel profiler CPU time load.
- **CPU>ServitudesLoadRatio**
  - double *
  - Controller motion kernel servitudes CPU time load.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  - No error.
7.2.1.5  ControllerRTTimeGet

**Name**

ControllerRTTimeGet – Gets the controller corrector period and corrector calculation time.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function gets the last exact value of the controller’s corrector period and the corrector calculation time.

---

**NOTE**

The default value of XPS controller corrector period is 0.125 ms (corresponding to an 8 kHz controller corrector frequency).

**Prototype**

```
int ControllerRTTimeGet(
    int SocketID,
    double * CurrentRTPeriod,
    double * CurrentRTUsage
)
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier used in each function.

**Output parameters**

- **CurrentRTPeriod**  
  double *  
  Controller corrector period (seconds).

- **CurrentRTUsage**  
  double *  
  Controller corrector calculation time (seconds).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.
7.2.1.6  **ControllerSlaveStatusGet**  [Extended]

**Name**

ControllerSlaveStatusGet – Gets the slave controller status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function, called from the master controller, gets the status of its slave controller(s). The slave controller status codes can take the following values:

- 0: All slave controllers are externally synchronized with the master controller.
- 1: The synchronization cable is not connected to any slave controller.
- 2: At least one slave controller is not externally synchronized with the master controller.

The description of slave controller(s) status codes can be obtained by “ControllerSlaveStatusStringGet” function sent from the master controller.

**Prototype**

```
int ControllerSlaveStatusGet(
    int SocketID, int * SlaveControllerStatus
)
```

**Input parameters**

SocketID  int  Socket identifier used in each function.

**Output parameters**

SlaveControllerStatus  int  Slave status of the controller.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.7  **ControllerSlaveStatusStringGet**  [Extended]

**Name**

**ControllerSlaveStatusStringGet** – Gets the slave controller’s status description from a slave controller status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the slave controller status description corresponding to a slave controller status code.
If the slave status code is not referenced then the function returns (-17) error.

**Prototype**

```c
int ControllerSlaveStatusStringGet(
    int SocketID,
    int SlaveControllerStatus,
    char * SlaveControllerStatusString
)
```

**Input parameters**

- **SocketID**  int  Socket identifier used in each function.
- **SlaveControllerStatus**  int  Slave controller status code.

**Output parameters**

- **SlaveControllerStatusString**  char *  Slave controller status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
7.2.1.8 **ControllerStatusGet**

**Name**

ControllerStatusGet – Gets the controller status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Returns the controller status code. The controller status codes are listed in section 8.10: “Controller Status List”.

The description of the controller status code can be obtained with the “ControllerStatusStringGet” function.

The controller status flag is automatically reset after a controller status reading using the ControllerStatusGet() command.

**Prototype**

```c
int ControllerStatusGet(
    int SocketID,
    int SlaveControllerStatus,
    char * SlaveControllerStatusString
)
```

**Input parameters**

SocketID int Socket identifier used in each function.

SlaveControllerStatus int Slave controller status code.

**Output parameters**

SlaveControllerStatusString char * Slave controller status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.9 ControllerStatusRead

Name
ControllerStatusRead – Reads the controller status code.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
Returns the controller status code. The controller status codes are listed in section “Group Status List”.
The description of the controller status code can be obtained with the “ControllerStatusStringGet” function.

Prototype
int ControllerStatusRead(int SocketID, int * ControllerStatus)

Input parameters
SocketID int Socket identifier used in each.
function.

Output parameters
ControllerStatus int * Status of the controller.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:
   No error.
7.2.1.10 **ControllerStatusStringGet**

**Name**

*ControllerStatusStringGet* – Gets the controller’s status description from a controller status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the controller status description corresponding to a controller status code (see section “Group Status List”). If the status code is not referenced then the “Unknown controller status code” message will be returned.

**Prototype**

```c
int ControllerStatusStringGet(
    int SocketID,
    int ControllerStatusCode,
    char * ControllerStatusString
)
```

**Input parameters**

- **SocketID** int  
  Socket identifier used in each function.
- **ControllerStatusCode** int  
  Controller status code.

**Output parameters**

- **ControllerStatus** char *  
  Controller status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.
7.2.1.11 ControllerSynchronizeCorrectorISR [Extended]

**Name**

ControllerSynchronizeCorrectorISR – Synchronizes the corrector ISR for master-slash controllers system.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function sets the mode of corrector ISR synchronization between master controller and its slave controllers.

Possible synchronization mode (ModeString) values:

- "MasterWithEcho": Turns a controller in the corrector ISR synchronization mode as Master. The master generates a synchronization signal (derived from its corrector ISR frequency) on a pin of the INHIBIT connector.
- "SlaveOnEcho": Turns a controller in the corrector ISR synchronization mode as Slave. The slave receives a synchronization signal (on a pin of INHIBIT connector) coming from its master and uses it as its corrector frequency.
- "Master": Return to local mode (each controller generates and uses its own corrector ISR frequency.

**Prototype**

```c
int ControllerSynchronizeCorrectorISR(  
    int SocketID,  
    char * ModeString  
 );
```

**Input parameters**

- **SocketID** int Socket identifier used in each function.
- **ModeString** char * Synchronization mode.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.12 **ConvertLineARCtoPTTrajectory**

**Name**

*ConvertLineARCtoPTTrajectory* - Converts LineArc trajectory to PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks File: (-61)
- Checks message queue: (-71)

**Description**

This function returns start and stop positions of the window used to synchronize the start or the stop of the pulses on absolute positions.

**Prototype**

```c
int ConvertLineARCtoPTTrajectory (
    int SocketID,
    char GroupName[255],
    char* FileName,
    double Velocity,
    double Acceleration,
    double DeltaT,
)
```

**Input parameters**

- **SocketID** `int` - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** `char *` - MultipleAxes group, XYZ group, XY group, TZ group, Hexapod.
- **FileName** `char*` - LineARC Trajectory File Name.
- **Velocity** `double` - Maximum trajectory velocity.
- **Acceleration** `double` - Maximum trajectory Acceleration.
- **DeltaT** `double` - Time interval.

**Output parameters**

- **StartPositionArray** `double*` - Window Start position.
- **EndPositionArray** `double*` - Window End position.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.13 **DataCollectionBufferReset** [Extended]

**Name**

*DataCollectionBufferReset* – Reset data collection buffer.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function clears any data in the data collection buffer.

**Prototype**

```c
int DataCollectionBufferReset(  
    int SocketID,  
  )
```

**Input parameters**

SocketID  
string  
Socket identifier used in each function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.14 DataCollectionBufferAndTimeReset [Extended]

Name
DataCollectionBufferAndTimeReset – Reset data collection buffer and time stamp.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function clears the data collection buffer and resets the data collection time stamp. It allows to reset data and time stamp at once with a function call only.

Prototype
int DataCollectionBufferAndTimeReset(
   int SocketID,
)

Input parameters
SocketID string Socket identifier used in each function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
7.2.1.15  DataCollectionRequest  [Extended]

**Name**

DataCollectionRequest – Gets frame of data collection.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check output data length: (-3)

**Description**

This function returns a frame that contains the requested first blocks (max 500) of current data collection.

The frame length can be from 0 (no block) to 500 blocks depending on the time between the successive calls of DataCollectionRequest function. If the number of available blocks is smaller than the requested blocks in the function call, the actual number of blocks will be returned without error.

**Example of a frame containing 4 data blocks**:

```
0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD
0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD
0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD
0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD 0x1234ABCD
```

**Prototype**

```c
int DataCollectionRequest(
    int SocketID,
    int NbRequestBlocks,
    int *NbReturnBlocks,
    char *Frame
)
```

**Input parameters**

- **SocketID** string: Socket identifier used in each function.
- **NbRequestBlocks** int: Number of data blocks to get.

**Output parameters**

- **NbReturnBlocks** int*: Number of actually returned blocks.
- **Frame** char*: Blocks of collected data.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long (data too long to return)
7.2.1.16 **DataCollectionTimeStampGet** [Extended]

**Name**

*DataCollectionTimeStampGet* – Gets data collection time stamp.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the time stamp in milliseconds that elapsed since the last reset.

**Prototype**

```c
int DataCollectionTimeStampGet(
    int SocketID,
    double *TimeStamp
)
```

**Input parameters**

- **SocketID**
  
  *string*
  
  Socket identifier used in each function.

**Output parameters**

- **TimeStamp**
  
  *double *
  
  Data collection current time stamp (milliseconds).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  
  No error.
7.2.1.17  **DataCollectionTimeStampReset**  [Extended]

**Name**

*DataCollectionTimeStampReset* – Reset data collection time stamp.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function resets internal millisecond counter used as time stamp for data collection.

**Prototype**

```
int DataCollectionTimeStampReset(
    int SocketID,
)
```

**Input parameters**

*SocketID*  
string  
Socket identifier used in each function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.18 DoubleGlobalArrayGet

Name
DoubleGlobalArrayGet – Gets the value of the global array of type “double”.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies the index number [0:1000]: (-17)

Description
This function gets the variable value from the global array of type “double”, related to a “Number” index. So, the first variable value from the global array is related to the index “0”.

The returned value is returned in a double format.

NOTE
The number of data points in the global array of type “double” is limited to 1000.

Prototype
int DoubleGlobalArrayGet(
    int SocketID,
    int Number,
    double * DoubleValue
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Number int Index in the global array.

Output parameters
DoubleValue double * Variable value.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
7.2.1.19 **DoubleGlobalArraySet**

**Name**

*DoubleGlobalArraySet* – Sets a value for the global array of type “double”.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies the index number [0:1000]: (-17)

**Description**

This function sets a new value in the global array located at the “Number” index and the new value is set in a double format.

---

**NOTE**

The first variable value from the global array is always located at index “0”.
The number of data points in the global array is limited to 1000, so the last index is “999”.

---

**Prototype**

```c
int DoubleGlobalArraySet(
    int SocketID,
    int Number,
    double DoubleValue
)
```

**Input parameters**

- **SocketID**
  - Type: int
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.
- **Number**
  - Type: int
  - Description: Index in the global array.
- **DoubleValue**
  - Type: double
  - Description: Variable value.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  - No error.
- **-17:**
  - Parameter out of range or incorrect.
7.2.1.20 **ElapsedTimeGet**

**Name**

ElapsedTimeGet – Gets the elapsed time since the controller was powered on.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the time in seconds that elapsed since the controller was powered on.

**Prototype**

```c
int ElapsedTimeGet(
    int SocketID,
    double * ElapsedTime
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **ErrorString** double *: Elapsed time (seconds).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.21 ErrorStringGet

Name
ErrorStringGet – Gets the error description from a function error code.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
The function returns the error description corresponding to a function error code (see section 8.7: “Positioner Driver Status List”).
If the error code is not referenced then the “Unknown error code” message will be returned.

Prototype
int ErrorStringGet(int SocketID, int ErrorCode, char * ErrorString)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
ErrorCode int Error code.

Output parameters
ErrorString char * Error description.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
7.2.1.22 **EventActionSetAndStart**

**Name**

*EventActionSetAndStart* – Defines a combination of one event and one action in buffer, it launches the event and action configuration and gives an ID of the set event.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Event parameters: (-40), (-8).
- Action parameters: (-17), (-8)
- Action to execute: (-32) “Gathering” action.
- Action name: (-39)
- Last action configured in memory: (-81)

**Description**

Defines a combination of one event and one action, it activates the event and the action. See event specification to see which are necessary. The actions are defined in section “Events and Actions” in the XPS user’s manual. Refer to section 8.2: “Actions List”.

*EventActionSetAndStart()* is useful to avoid conflict between Events/Actions configurations set from many processes that run in parallel.

---

**NOTE**

For the “ExecuteTCLScript” action, the “ActionParameter3” represents a list of arguments, which must be separated with a semicolon (;).

---

**Prototype**

```c
int EventActionSetAndStart (  
    int SocketID,  
    char * ExtendedEventName,  
    char * EventParameter1,  
    char * EventParameter2,  
    char * EventParameter3,  
    char * EventParameter4  
    char * ExtendedActionName,  
    char * ActionParameter1,  
    char * ActionParameter2,  
    char * ActionParameter3,  
    char * ActionParameter4  
    int*   EventId)
```
**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **ExtendedEventName**
  - char *
  - event name (maximum size = 250). The events are defined in section “Events and Actions” in the XPS user’s manual.

- **EventParameter1**
  - char *
  - optional event’s parameter #1 (maximum size = 250).

- **EventParameter2**
  - char *
  - optional event’s parameter #2 (maximum size = 250).

- **EventParameter3**
  - char *
  - optional event’s parameter #3 (maximum size = 250).

- **EventParameter4**
  - char *
  - optional event’s parameter #4 (maximum size = 250).

- **ExtendedActionName**
  - char *
  - action full name (maximum size = 250).

- **ActionParameter1**
  - char *
  - optional action’s parameter #1 (maximum size = 250).

- **ActionParameter2**
  - char *
  - optional action’s parameter #2 (maximum size = 250).

- **ActionParameter3**
  - char *
  - optional action’s parameter #3 (maximum size = 250).

- **ActionParameter4**
  - char *
  - optional action’s parameter #4 (maximum size = 250).

**Output parameters**

- **EventId**
  - int *
  - event Id

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -32: Gathering not configured.
- -39: Mnemonic action doesn't exist.
7.2.1.23 EventExtendedAllGet

**Name**

EventExtendedAllGet – Gets all “event and action” identifiers in progress.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Event ID: (-83).

**Description**

Gets the list of all “event and action” combination identifiers from the event scheduler (filled by the ExtendedEventStart or ExtendedEventWait functions).

The list separator is a comma. If no “event and action” combination is in progress (in the event scheduler) then the error (-83) is returned.

**Prototype**

```c
int EventExtendedAllGet(
    int SocketID,
    int EventID,
    char * EventIdentifiersList
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **EventID** int: “Event and action” identifier from “ExtendedEventStart”.

**Output parameters**

- **EventIdentifiersList** char*: List of “event and action” identifiers in scheduler.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -83: Event ID not defined.
7.2.1.24 EventExtendedConfigurationActionGet

Name

EventExtendedConfigurationActionGet – Gets the action combination defined in buffer.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks last action configuration in memory: (-81)

Description

Returns the combination of action(s) defined by “EventExtendedConfigurationActionSet” function. If no action is configured in the buffer, (-81) error is returned.

Prototype

int EventExtendedConfigurationActionGet(
    int SocketID,
    char * ActionConfiguration
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
EventID int “Event and action” identifier from “ExtendedEventStart”.

Output parameters

ActionConfiguration char * Action combination configured in buffer.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -81: Action not configured.
7.2.1.25 EventExtendedConfigurationActionSet

Name
EventExtendedConfigurationActionSet – Defines a combination of one or several actions in buffer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Action parameters: (-17), (-8)
- Action to execute: (-32) “Gathering” action.
- Action name: (-39)
- Last action configured in memory: (-81)

Description
Defines a combination of one or several actions but does not activate the actions. Use the “EventExtendedStart” function to activate these defined actions. For each action, 4 parameters can be configured … see event specification to see which are necessary. The actions are defined in section “Events and Actions” in the XPS user’s manual.

The number of actions in a combination is limited to 10 actions.

Refer to section 8.2: “Actions List”.

NOTE
Before activating the defined actions, you must configure the events. Only then, can you use the “EventExtendedStart” or “EventExtendedWait” function.
For the “ExecuteTCLScript” action, the “ActionParameter3” represents a list of arguments, which must be separated with a semicolon (;).

Prototype
int EventExtendedConfigurationActionSet(
    int SocketID,
    int NbElements,
    char * ExtendedActionName,
    char * ActionParameter1,
    char * ActionParameter2,
    char * ActionParameter3,
    char * ActionParameter4)
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>NbElements</td>
<td>int</td>
<td>Number of events in configuration.</td>
</tr>
<tr>
<td>ExtendedActionName</td>
<td>char *</td>
<td>Event full name (maximum size = 250). The events are defined in section “Events and Actions” in the XPS user’s manual.</td>
</tr>
<tr>
<td>ActionConfiguration</td>
<td>char *</td>
<td>Action combination configured in buffer.</td>
</tr>
<tr>
<td>ActionParameter1</td>
<td>char *</td>
<td>Optional action’s parameter #1 (maximum size = 250).</td>
</tr>
<tr>
<td>ActionParameter2</td>
<td>char *</td>
<td>Optional action’s parameter #2 (maximum size = 250).</td>
</tr>
<tr>
<td>ActionParameter3</td>
<td>char *</td>
<td>Optional action’s parameter #3 (maximum size = 250).</td>
</tr>
<tr>
<td>ActionParameter4</td>
<td>char *</td>
<td>Optional action’s parameter #4 (maximum size = 250).</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -32: Gathering not configured.
- -39: Mnemonic action doesn’t exist.
7.2.1.26 EventExtendedConfigurationTriggerGet

Name
EventExtendedConfigurationTriggerGet – Gets the trigger defined in the buffer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Last event configuration in memory: (-80)

Description
Returns the last event defined in buffer by “EventExtendedConfigurationTriggerSet” function.
If no event is defined in buffer, (-80) error is returned.

NOTE
This function doesn’t return the last activated event. An event can be configured but not activated.

Prototype
int EventExtendedConfigurationTriggerGet(
    int SocketID,
    char * EventTriggerConfiguration
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
EventTriggerConfiguration char * Event combination configured in buffer.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -80: Event not configured.
7.2.1.27 EventExtendedConfigurationTriggerSet

**Name**

EventExtendedConfigurationTriggerSet - Defines a combination of one or several events in buffer.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Event actor: (-8)
- Event name: (-40)

**Description**

Defines one trigger (combination of one or several events). To activate the trigger, use the “EventExtendedStart” function. For each event, 4 parameters can be configured… see event specification to see the necessary parameters. The events are defined in section “Events and Actions” in the XPS user’s manual.

The number of events in a combination is limited to 10 events.

Each full event name is defined as `[actor].[category].event` (see Event list):
- [actor] - Optional actor name (Group name, Positioner name, GPIO name or Nothing)
- [category] - Optional category name (Event category or Nothing)
- event - Event name

**NOTE**

Before activating this event combination, you must define one or several action(s) with the “EventExtendedConfigurationTriggerSet” function. Next, use the “EventExtendedStart” or “EventExtendedWait” function to launch these defined “event and action”.

**Prototype**

```c
int EventExtendedConfigurationTriggerSet(
    int SocketID,
    int NbElements,
    char * ExtendedEventName,
    char * EventParameter1,
    char * EventParameter2,
    char * EventParameter3,
    char * EventParameter4
)
```
Input parameters

- SocketID: int
  Socket identifier gets by the “TCP_ConnectToServer” function.

- NbElements: int
  Number of events in configuration.

- ExtendedEventName: char *
  List of event full names (maximum size = 250) – separator is ‘;’.

- EventParameter1: char *
  List of optional event’s parameter #1 (maximum size = 250).

- EventParameter2: char *
  List of optional event’s parameter #2 (maximum size = 250).

- EventParameter3: char *
  List of optional event’s parameter #3 (maximum size = 250).

- EventParameter4: char *
  List of optional event’s parameter #4 (maximum size = 250).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:
  No error.

- -8:
  Wrong object type for this command.

- -40:
  Mnemonic event doesn't exist.
7.2.1.28 **EventExtendedGet**

**Name**

**EventExtendedGet** – Gets the details of “event and action” combinations in scheduler defined by an identifier.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Event identifier [0:49]: (-83)

**Description**

Returns the composition of events and actions in progress defined by an identifier. This identifier is defined in the “EventExtendedStart” function. The identifier must be defined between 0 and 49, if its value is “–1” then it’s not defined. If the configured event is already deleted, (-83) error is returned.

**Prototype**

```c
int EventExtendedGet(
    int SocketID,
    int EventID,
    char * EventConfiguration,
    char * ActionConfiguration
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **EventID** int “Event and action” identifier from “ExtendedEventStart”.

**Output parameters**

- **EventConfiguration** char * Event combination defined in scheduler.
- **ActionConfiguration** char * Action combination defined in scheduler.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-83:** Event ID not defined.
7.2.1.29 EventExtendedRemove

Name

EventExtendedRemove – Removes an “event and action” combination in the scheduler defined by an identifier.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor event: (-8)
- Event identifier [0:49]: (-17), (-83)

Description

Deletes the “event(s) and action(s)” combination in the scheduler defined by an event identifier. This identifier is defined in the “EventExtendedStart” function.

The identifier must be defined between 0 and 49, or -1. If the identifier is equal to “-1”, the EventExtendedRemove function removes all current “event and action” combinations.

If the configured event is already deleted, (-83) is returned.

Prototype

```
int EventExtendedRemove(
    int SocketID,
    int EventID
)
```

Input parameters

- SocketID int: Socket identifier gets by the “TCP_ConnectToServer” function.
- EventID int: “Event and action” identifier.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -83: Event ID not defined.
### 7.2.1.30 EventExtendedStart

**Name**

**EventExtendedStart** – Activates the “event and action” defined in the buffer.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Event name to execute: (-8), (-40)
- Last event configuration in memory: (-80)
- Last action configuration in memory: (-81)
- Number of compositions in execution: (-82)

**Description**

Launches the configured event(s) and action(s) from the event configuration buffer into the event scheduler and gets an event identifier. The identifier must be defined between 0 and 49, if its value is “–1” then that means it’s not defined.

If no event is configured in buffer, (-80) error is returned.

If no action is configured in buffer, (-81) error is returned.

In the event scheduler, when a configured event has occurred it is deleted from the event scheduler.

**NOTE**

If the configured event is PERMANENT then it is not deleted after it occurs, and must use the “EventExtendedRemove” function to delete it.

**CAUTION**

Prototype

```c
int EventExtendedStart(  
    int SocketID,  
    int EventID  
)
```
Input parameters
SocketID        int  Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
EventID        int *  “Event and action” identifier.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -40: Mnemonic event doesn't exist.
- -80: Event not configured.
- -81: Action not configured.
- -82: Event buffer is full.
7.2.1.31 EventExtendedWait

Name
EventExtendedWait – Activates the last “event” configuration in memory and wait until it occurs.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Event actor: (-8)
- Last event configuration in memory: (-80)
- Number of compositions in execution: (-82)

Description
Launches the last configured event(s) into the event scheduler and wait until it occurs to unlock the socket.

If no “event and action” combination is configured in the event configuration buffer, (-80) error is returned.

Prototype

```c
int EventExtendedWait(
    int SocketID
)
```
**Input parameters**

SocketID int  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -40: Mnemonic event doesn't exist.
- -80: Event not configured.
- -82: Event buffer is full.
7.2.1.32 **ExternalInterlockErrorStringGet [MODULE]**

**Name**

`ExternalInterlockErrorStringGet` – Gets the external interlock error description.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Optional module load in memory: (-97)

**Description**

This function returns an external interlock error description from an external interlock error code. This external interlock error code value is between 0 to 65535 and is represented on 16 bits as following:

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error Bit #</th>
<th>Error description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>No error</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>Error #1</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>Error #2</td>
</tr>
<tr>
<td>4</td>
<td>2</td>
<td>Error #3</td>
</tr>
<tr>
<td>8</td>
<td>3</td>
<td>Error #4</td>
</tr>
<tr>
<td>16</td>
<td>4</td>
<td>Error #5</td>
</tr>
<tr>
<td>…</td>
<td>…</td>
<td>…</td>
</tr>
<tr>
<td>32768</td>
<td>15</td>
<td>Error #15</td>
</tr>
</tbody>
</table>

**NOTE**

`Error #x` is defined in relation to the referenced errors managed by the External Interlock optional module load in memory.

See section 8.11: “Positioner Error List”.

**Prototype**

```c
int ExternalInterlockErrorStringGet (  
    int SocketID,  
    int ErrorCode,  
    char * ErrorDescription  
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.
- `ErrorCode` int*: External interlock error code.

**Output parameters**

- `ErrorDescription` char*: External interlock error description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -98: Error of loading an optional module
7.2.1.33 ExternalInterlockGroupErrorGet [MODULE]

Name
ExternalInterlockGroupErrorGet – Gets the current external group interlock error code.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid group type: (-8)
- Valid Group name: (-19)
- External group interlock configuration: (-205)

Description
This function returns the current external group interlock error code. It must be used after the erreur -202 to get interlock error description.
The external group interlock error code is a 16 bit word and its value is between 0 to 65535.

NOTE
See section 8.11: “Positioner Error List”.

Prototype
int ExternalInterlockGroupErrorGet (  
    int SocketID,  
    char GroupName[250],  
    int *CurrentErrorCode  
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
CurrentErrorCode int * Current external group interlock error code.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -205: Not enable in your configuration
7.2.1.34 ExternalInterlockLiftPinErrorGet [MODULE]

**Name**

`ExternalInterlockLiftPinErrorGet` – Gets the current external lift pin interlock error code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid SingleAxis group type: (-8)
- Valid Group name: (-19)
- External group interlock configuration: (-205)

**Description**

This function returns the current external lift pin interlock error code. It must be used after the error -202 to get interlock error description. This command is compatible with SingleAxis group only.

The external lift pin interlock error code is a 16 bit word and its value is between 0 to 65535.

---

**NOTE**

See section 8.11: “Positioner Error List”.

---

**Prototype**

```c
int ExternalInterlockLiftPinErrorGet (  
    int SocketID,  
    char GroupName[250],  
    int *CurrentErrorCode
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char*: Group name (SingleAxis only).

**Output parameters**

- **CurrentErrorCode** int*: Current external lift pin interlock error code.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -205: Not enable in your configuration
7.2.1.35 **ExternalModuleErrorStringGet**

**Name**

*ExternalModuleErrorStringGet* – Gets the external interlock error description.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Optional module load in memory: (-97)

**Description**

This function returns an error description from an error code. This error code value is between 0 to 65535 and is represented on a 16 bit word:

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error Bit #</th>
<th>Error description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>No error</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>Error #1</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>Error #2</td>
</tr>
<tr>
<td>4</td>
<td>2</td>
<td>Error #3</td>
</tr>
<tr>
<td>8</td>
<td>3</td>
<td>Error #4</td>
</tr>
<tr>
<td>16</td>
<td>4</td>
<td>Error #5</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>32768</td>
<td>15</td>
<td>Error #15</td>
</tr>
</tbody>
</table>

**NOTE**

*Error #x* is defined in relation to the referenced errors managed by the optional module load in memory.

If *Error #x* is not referenced by the optional module then the function returns “Unknown error”

**Prototype**

```c
int ExternalModuleErrorStringGet ( 
    int SocketID, 
    int ModuleNumber, 
    int ErrorCode, 
    char * ErrorDescription 
)
```

**Input parameters**

- **SocketID**  
  - * int 
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **ModuleName**  
  - * int 
  - External module number [1:4]
- **ErrorCode**  
  - * int 
  - Error code.

**Output parameters**

- **ErrorDescription**  
  - * char * 
  - Error description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-17:** Parameter out of range or incorrect.
### 7.2.1.36 ExternalModuleFirmwareVersionGet

**Name**

**ExternalModuleFirmwareVersionGet** – Gets the firmware version of an ExternalModule.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the module number (must >=1 and <= NbExternalModules): (-17)

  Here: *NbExternalModules* is the number of modules declared in the line *SharedLibraryModuleNames of system.ref*

**Description**

This function gets the firmware version of an ExternalModule.

**Prototype**

```c
int ExternalModuleFirmwareVersionGet(
    int SocketID,
    int ModuleNumber,
    char *Version
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>ModuleNumber</td>
<td>int</td>
<td>External module number</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>char *</td>
<td>External module firmware version.</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
7.2.1.37 **ExternalModuleTemplateNumberGet**

**Name**

*ExternalModuleTemplateNumberGet* – Gets the expected external module template number managed by the XPS controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function gets the expected external module template number. All user external modules must be developed from this template to be compatibles.

If one of the user external modules is not compatible then an XPS boot error will be generated.

**Prototype**

```c
int ExternalModuleTemplateNumberGet (  
    int SocketID,  
    char *TemplateNumber  
)
```

**Input parameters**

- **SocketID**
  
  int
  
  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **TemplateNumber**
  
  char *
  
  Expected external module template number. (“N\text{x}” with x the template number)

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  
  No error.
7.2.1.38  **ExternalModuleScanFuncTimeDurationsGet**

**Name**

`ExternalModuleScanFuncTimeDurationsGet` – Gets the current and the maximum scan executing time for an ExternalModule.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the module number (must >=1 and <= `NbExternalModules`): (-17)
- Here: `NbExternalModules` is the number of modules declared in the line
  `SharedLibraryModuleNames` of `system.ref`

**Description**

An ExternalModule has a scan function that is called periodically by Newport MotionKernel. This function gets the current and the maximum scan executing time for an ExternalModule.

**Prototype**

```c
int ExternalModuleScanFuncTimeDurationsGet(
    int SocketID,
    int ModuleNumber,
    double *CurrentDuration,
    double *MaximumDuration
)
```

**Input parameters**

- **SocketID**  int  Socket identifier gets by the
  “TCP_ConnectToServer” function.
- **ModuleNumber**  int  External module number

**Output parameters**

- **CurrentDuration**  char *  Current scan executing duration.
- **MaximumDuration**  char *  Maximum scan executing duration.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -17: Parameter out of range or incorrect.
7.2.1.39 **ExternalModuleSocketFree**

**Name**

**ExternalModuleSocketFree** – Free the socket previously reserved for an ExternalModule.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the module number (must >=1 and <= NbExternalModules): (-17)
  
  Here: *NbExternalModules* is the number of modules declared in the line *SharedLibraryModuleNames* of *system.ref*

**Description**

This function frees the socket previously reserved for an ExternalModule. If the function is executed successfully via this socket all the controller functions (*like FirmwareVersionGet(), ElapsedTimeGet(), ErrorStringGet(), ...*) become active, while ExternalModule functions (*like ExternalModuleTZPositionCurrentGet(), ExternalModuleGPIODigitalInputGet(), ...*) become inactive.

*(return error -18: Positioner Name doesn’t exist or unknown command).*

**Prototype**

```c
int ExternalModuleSocketFree(
    int SocketID,
    int ModuleNumber
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **ModuleName**
  - int
  - External module number

**Output parameters**

None

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0:
  - No error.
- -17:
  - Parameter out of range or incorrect.
### 7.2.1.40 **ExternalModuleSocketReserve**

#### Name

**ExternalModuleSocketReserve** – Reserves the current socket for an ExternalModule.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the module number (must $\geq 1$ and $\leq NbExternalModules$): (-17)
  
  Here: $NbExternalModules$ is the number of modules declared in the line `SharedLibraryModuleNames` of `system.ref`

- Checks if the current socket is already reserved for another ExternalModule: (-22)
- Checks if the ExternalModule has already been linked with another socket: (-22)

#### Description

- To be able to execute the own API functions of an ExternalModule via a TCP Terminal, the user must reserve a socket for this ExternalModule.
- This function reserves the current socket for an ExternalModule. If the function is executed successfully, via this socket the own ExternalModule functions (like `ExternalModuleTZPositionCurrentGet()`, `ExternalModuleGPIODigitalInputGet()`, ...) become functioning, whereas the controller functions (like `FirmwareVersionGet()`, `ElapsedTimeGet()`, `ErrorStringGet()`, ...) become inactive (return `Unknown command`).

#### Prototype

```c
int ExternalModuleSocketReserve(
    int SocketID,
    int ModuleNumber
)
```

#### Input parameters

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **ModuleNumber**
  - int
  - External module number

#### Output parameters

None

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-17:** Parameter out of range or incorrect.
- **-22:** Not allowed action.
7.2.1.41 FileGatheringRename

Name

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This API renames the “Gathering.dat” file with another .dat file name.

Prototype
int FileGatheringRename(
    int SocketID,
    char * NewFileName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
NewFileName char * New file name used to rename “Gathering.dat”.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.1.42  FileScriptHistoryRename

Name
FileScriptHistoryRename – Renames “history.tcl” file

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This API renames the “history.tcl” file with another tcl file name.

Prototype
int FileScriptHistoryRename(
   int SocketID,
   char * NewFileName
)

Input parameters
SocketID    int     Socket identifier gets by the “TCP_ConnectToServer” function.
NewFileName char *    New file name used to rename “history.tcl”.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
### 7.2.1.43 FirmwareBuildVersionNumberGet

**Name**
FirmwareBuildVersionNumberGet – Gets the built firmware version

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function gets the controller name and the firmware version.
Example of returned version string:
“XPS Unified Firmware V1.0.0”
- Controller name is XPS.
- Firmware version is V1.0.0.

**Prototype**

```c
int FirmwareBuildVersionNumberGet(
    int SocketID,
    char * Version
)
```

**Input parameters**

- **SocketID** int 
  Socket identifier gets by the TCP_ConnectToServer function.

**Output parameters**

- **Version** char *
  Controller firmware version.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0:** No error.
7.2.1.44 FirmwareVersionGet

Name
FirmwareVersionGet – Gets the version of the controller.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function gets the controller version defined in firmware.ref.
Example of returned version string: “XPS-Q8 V2.1.0”

Prototype
int FirmwareVersionGet(
    int SocketID,
    char * Version
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
Version char * Controller version.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.1.45  GatheringConfigurationGet

Name
GatheringConfigurationGet – Gets the current configuration of internally triggered data gathering.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)

Description
This function returns the current configuration of internally triggered data gathering.
Use the “GatheringListGet” function to retrieve a complete list of allowed gathering types.
For a more thorough description of the internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

Prototype
int GatheringConfigurationGet(int SocketID, char * TypeList)

Input parameters
SocketID  int  Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
TypeList  char *  List of configured gathering types (separator is semicolon).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -32: Gathering not configured.
7.2.1.46 GatheringConfigurationSet

Name
GatheringConfigurationSet – Sets a data gathering action.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input gathering mnemonic: (-29)
- Gathering must not be in progress: (-43)

Description
Defines one or several types of data gathered during the internal triggered data gathering.
Maximum of 1000000 points can be acquired.
Maximum of 25 data types can be configured in a gathering.
Refer to section 8.3: “Gathering Data Types”.
The “GatheringListGet” function can be used to retrieve a complete list of gathering types.
For a more thorough description of the internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

Prototype
int GatheringConfigurationSet(
    int SocketID,
    int NbElements,
    char * TypeArray
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
NbElements int Number of types.
TypeArray char * Array of configured gathering types.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -29: Mnemonic gathering type doesn't exist.
- -32: Gathering not configured.
- -43: Gathering running.
7.2.1.47 GatheringCurrentNumberGet

Name
GatheringCurrentNumberGet – Gets the current and maximum number of gathered data points.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)

Description
This function returns the current and maximum number of data points gathered during the internal triggered data gathering.

For more thorough description of the internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

Prototype
int GatheringCurrentNumberGet(
    int SocketID,
    int * CurrentNumber,
    int * MaxSamplesNumber
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
CurrentNumber int * Current number during acquisition.
MaxSamplesNumber int * Maximum number of samples.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -32: Gathering not configured.
7.2.1.48 GatheringDataAcquire

Name
GatheringDataAcquire – Manually Acquires one data set.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)
- Gathering must not be in progress: (-43)
- Checks gathering buffer size: (-111)

Description
This function manually acquires one data set configured by “GatheringConfigurationSet” function.

Prototype
int GatheringDataAcquire(int SocketID)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -32: Gathering not configured.
- -43: Gathering running.
- -111: Gathering buffer is full.
7.2.1.49 GatheringDataGet

Name
GatheringDataGet – Reads one data line from the current gathering buffer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks index number: (-17)
  • IndexPoint ≥ 0.
  • IndexPoint < currently gathered data number.
- Checks gathering state: (-32)

Description
This function reads a line of data from the current gathering buffer. The buffer line number is defined by the index of an acquired point.
The separator is “;” in the returned data line.
Gathering must be configured in order to use this function, otherwise (-32) error is returned.

Prototype
int GatheringDataGet(int SocketID, int IndexPoint, char * DataBufferLine)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
IndexPoint int Index of an acquired data from the current gathering buffer.

Output parameters
DataBufferLine char * String contains values from the current buffer at the selected index.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -32: Gathering not configured.
7.2.1.50 GatheringDataMultipleLinesGet

Name
GatheringDataMultipleLinesGet – Reads several data lines from the current gathering buffer in memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks index number: (-17)
  - IndexPoint ≥ 0 (Note: index #0 = line #1)
  - IndexPoint ≤ currently gathered data number.
- Checks gathering state: (-32)
- Check gathering output data lines length (-3)

Description
This function reads one or several data lines from the current gathering buffer. The buffer line number is defined by the index of an acquired point.
The separator is “;” in the returned data line and the end of each line is carriage return “\n”.
Gathering must be configured in order to use this function, otherwise (-32) error is returned.
If the requested lines number is too grand that make output data exceeds limit (65535), (-3) error is returned.

Example of gathering buffer in memory:

<table>
<thead>
<tr>
<th>index</th>
<th>Data1</th>
<th>Data2</th>
<th>Data3</th>
<th>Data4</th>
<th>Data5</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 →</td>
<td>1</td>
<td>10</td>
<td>0.1</td>
<td>21</td>
<td>100</td>
</tr>
<tr>
<td>1 →</td>
<td>2</td>
<td>20</td>
<td>0.2</td>
<td>22</td>
<td>102</td>
</tr>
<tr>
<td>2 →</td>
<td>3</td>
<td>30</td>
<td>0.3</td>
<td>23</td>
<td>103</td>
</tr>
<tr>
<td>3 →</td>
<td>4</td>
<td>40</td>
<td>0.4</td>
<td>24</td>
<td>104</td>
</tr>
<tr>
<td>5 →</td>
<td>5</td>
<td>50</td>
<td>0.5</td>
<td>25</td>
<td>105</td>
</tr>
</tbody>
</table>

GatheringDataMultipleLinesGet(1, 4, char *), here:
1 => the start line is #2
4 => the number of lines to read is 4
char * => buffer to get the data (65535 characters maximum)

<table>
<thead>
<tr>
<th>index</th>
<th>Data1</th>
<th>Data2</th>
<th>Data3</th>
<th>Data4</th>
<th>Data5</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 →</td>
<td>2</td>
<td>20</td>
<td>0.2</td>
<td>22</td>
<td>102</td>
</tr>
<tr>
<td>2 →</td>
<td>3</td>
<td>30</td>
<td>0.3</td>
<td>23</td>
<td>103</td>
</tr>
<tr>
<td>3 →</td>
<td>4</td>
<td>40</td>
<td>0.4</td>
<td>24</td>
<td>104</td>
</tr>
<tr>
<td>4 →</td>
<td>5</td>
<td>50</td>
<td>0.5</td>
<td>25</td>
<td>105</td>
</tr>
</tbody>
</table>

Data result:
2;20;0.2;22;102
3;30;0.3;23;103
4;40;0.4;24;104
5;50;0.5;25;105
Prototype
int GatheringDataMultipleLinesGet(
    int SocketID,
    int IndexPoint,
    int NbLines,
    char * DataBufferLine
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
IndexPoint int Index of an acquired data from the current gathering buffer.
NbLines int Number of lines to get.

Output parameters
DataBufferLine char * String contains values from the current buffer at the selected index.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -17: Parameter out of range or incorrect.
• -32: Gathering not configured.
• -3: String too long.
7.2.1.51  GatheringExternalConfigurationGet

Name
GatheringExternalConfigurationGet – Gets the current configuration of an externally triggered data gathering.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)

Description
This function returns the current configuration of an externally triggered data gathering. Use the “GatheringExternalListGet” function to retrieve a complete list of external gathering types. For a more thorough description of the external data gathering capability, please refer to section Data Gathering/External Data Gathering of XPS Motion Tutorial.

Prototype
int GatheringExternalConfigurationGet(int SocketID, char * TypeList)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
TypeList char * List of configured gathering types (separator is semicolon).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -32: Gathering not configured.
7.2.1.52 GatheringExternalConfigurationSet

**Name**

`GatheringExternalConfigurationSet` – Sets an external data gathering.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input external gathering mnemonic: (-29)
- Gathering must not be in progress: (-43)

**Description**

Defines one or several types of data gathered during externally triggered data gathering. Maximum of 1000000 points can be acquired. Maximum of 25 data types can be configured in a gathering. Refer to section 8.4: “External Gathering Data Types”. The “GatheringExternalListGet” function can be used to retrieve a complete list of gathering types.

For more thorough description of the external data gathering capability, please refer to section Data Gathering/External Data Gathering XPS Motion Tutorial.

**Prototype**

```c
int GatheringExternalConfigurationSet(
    int SocketID,
    int NbElements,
    char * TypeArray
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **NbElements** int: Number of types.
- **TypeArray** char *: Array of configured gathering types.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -29: Mnemonic gathering type doesn't exist.
- -43: Gathering running.
7.2.1.53 GatheringExternalCurrentNumberGet

**Name**
GatheringExternalCurrentNumberGet – Gets the current and maximum number of externally gathered data points.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- External gathering must be configured: (-32)

**Description**
This function returns the current and maximum number of data points gathered during an externally triggered data gathering.

For more thorough description of external data gathering capability, please refer to section Data Gathering/External Data Gathering XPS Motion Tutorial.

**Prototype**
```c
int GatheringExternalCurrentNumberGet(
    int SocketID,
    int * CurrentNumber,
    int * MaxSamplesNumber
)
```

**Input parameters**
- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- **CurrentNumber** int: Current number during acquisition.
- **MaxSamplesNumber** int: Maximum number of samples.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -32: Gathering not configured.
7.2.1.54  GatheringExternalDataGet

Name
GatheringExternalDataGet – Reads one line of data from current external gathering buffer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks index number: (-17)
  •  IndexPoint ≥ 0.
  •  IndexPoint < currently gathered data number.
- Checks gathering state: (-32)

Description
This function reads a line of data from current gathering gathering buffer. The buffer line number is defined by the index of an acquired point. The separator is “;” in the returned data line. Gathering must be configured in order to use this function, otherwise (-32) error is returned.

Prototype
int GatheringExternalDataGet(
    int SocketID,
    int IndexPoint,
    char * DataBufferLine
)

Input parameters
SocketID  int  Socket identifier gets by the “TCP_ConnectToServer” function.
IndexPoint  int  Index of an acquired data from the current gathering buffer.

Output parameters
DataBufferLine  char *  String contains values from the current buffer at the selected index.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
•  0: No error.
•  -17: Parameter out of range or incorrect.
•  -32: Gathering not configured.
7.2.1.55 **GatheringExternalStopAndSave**

**Name**

*GatheringExternalStopAndSave* – Stops externally triggered data gathering and saves the data into the XPS controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of data (≥0): (-30)
- Checks file opening: (-60)

**Description**

This function stops externally triggered data gathering and saves the data into the XPS controller. Gathered data is stored in the “GatheringExternal.dat” file under “..\Public” folder of XPS controller.

For more thorough description of external data gathering capability, please refer to section Data Gathering/External Data Gathering of XPS Motion Tutorial.

**Prototype**

```c
int GatheringExternalStopAndSave(
    int SocketID
)
```

**Input parameters**

- **SocketID**: int

  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-30**: Gathering not started.
- **-60**: Error during file writing or file doesn't exist.
7.2.1.56 **GatheringReset**

**Name**
GatheringReset – Resets gathered data to start new gathering.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must not be in progress: (-43)

**Description**
This function resets to start a brand new gathering.
The number of gathered data is set to zero.
For more thorough description of internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

**Prototype**
```
int GatheringReset(int SocketID)
```

**Input parameters**
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -43: Gathering running.
7.2.1.57  GatheringRun

**Name**

GatheringRun – Starts to gather data.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)
- Gathering must not be in progress: (-43)

**Description**

This function starts data gathering. Data gathering needs to be configured before using this function (See GatheringConfigurationSet function)

The parameters are the number of data points to be gathered and the divisor of the frequency (servo frequency) at which the data gathering will be done.

For more thorough description of the internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

**Prototype**

```c
int GatheringRun(
    int SocketID,
    int DataNumber,
    int Divisor
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **DataNumber** int: The number of data line to gather.
- **Divisor** int: The divisor of the servo frequency.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -32: Gathering not configured.
- -43: Gathering running.
7.2.1.58 **GatheringRunAppend**

**Name**

GatheringRunAppend – : Restarts gathering from the point it was stopped.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Gathering must be configured: (-32)
- Gathering must not be in progress: (-43)

**Description**

Restarts gathering from the data point it was stopped as long as gathering current data number has not reached the DataNumber previously specified by GatheringRun() function. This function repeats the gathering from the data point that was previously stopped, while the gathering current data number has not reached the DataNumber previously specified using the GatheringRun() function.

The gathering must be configured, executed and stopped before using this function (see GatheringConfigurationSet, GatheringRun, GatheringStop functions).

For more thorough description of the internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

**Prototype**

```c
int GatheringRunAppend(
    int SocketID
)
```

**Input parameters**

| SocketID | int | Socket identifier gets by the “TCP_ConnectToServer” function. |

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -32: Gathering not configured.
- -43: Gathering running.
7.2.1.59 GatheringStop

Name
GatheringStop – Stops internally and externally triggered data gathering.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of data (>0): (-30)
- Checks file opening: (-60)

Description
This function stops internally and externally triggered data gathering. To save to a file, use GatheringStopAndSave function.

For more thorough description of data gathering capability, please refer section Data Gathering/ of XPS Motion Tutorial.

Prototype
int GatheringStop(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -30: Gathering not started.
- -60: Error during file writing or file doesn't exist.
7.2.1.60 GatheringStopAndSave

Name
GatheringStopAndSave – Stops internally triggered data gathering and saves data into the XPS controller.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of data (>0): (-30)
- Checks file opening: (-60)

Description
This function stops internally triggered data gathering as well as saves the data to the XPS controller. Data is stored in GATHERING.DAT file under “..\Public” folder of the XPS controller.

For more thorough description of internal data gathering capability, please refer to section Data Gathering/Internal Data Gathering of XPS Motion Tutorial.

Prototype
int GatheringStopAndSave(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -30: Gathering not started.
- -60: Error during file writing or file doesn't exist.
7.2.1.61 GetLibraryVersion

**Name**
GetLibraryVersion – Gets the version of the DLL library.

**Input tests**
None.

**Description**
This function returns the version of DLL library.
The library version represents the firmware version that was used to build the library.

**Prototype**
```c
int GetLibraryVersion(
    int SocketID
)
```

**Input parameters**
- **SocketID** int
  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- **LibVersion** char *
  DLL library version.

**Return**
None.
7.2.1.62  **GlobalArrayGet**

**Name**

GlobalArrayGet – Gets the variable value from the global array.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies the index number [0:100]; (-17)

**Description**

This function gets the variable value from the global array, related to “Number” index in a string format.

The first variable value from the global array is referenced to index “0”.

---

**NOTE**

The number of data points in the global array is limited to 100.

---

**NOTE**

The maximum string length is fixed to 100 characters.

---

**Prototype**

```c
int GlobalArrayGet(
    int SocketID,
    int Number,
    char * StringValue
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Number** int Index in the global array.

**Output parameters**

- **StringValue** char * Variable string value (100 characters max).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-17:** Parameter out of range or incorrect.
7.2.1.63 GlobalArraySet

Name
GlobalArraySet – Sets the value of the global array.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies the index number [0:100]: (-17)
- Check input string not null: (-17)
- Check input string length (100 characters max): (-3)

Description
This function sets a new value in the global array related to the “Number” index and the new value is set to a string.

NOTE
The first variable value of the global array is always referenced to the index “0”.
The number of data points in the global array is limited to 100, so the last index is “99”.

NOTE
The maximum string length is fixed to 100 characters.

Prototype
int GlobalArraySet(
    int SocketID,
    int Number,
    char * StringValue
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Number int Index in the global array.
StringValue char * Variable string value (100 characters max).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -3: String too long
- -17: Parameter out of range or incorrect.
7.2.1.64  **GPIOAnalogGainGet**

**Name**

GPIOAnalogGainGet – Gets the gain for one or several analog inputs (ADC).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks board: (-8)
- GPIO name (ADC): (-8)
- Hardware compatibility or XPS initialization in progress: (-22)

**Description**

Gets the gain value for one or several analog inputs. Please refer to Appendix B.5 Analog I/O of the XPS Motion Tutorial for further information about ADC gain.

The gain value must be 1, 2, 4 or 8.

The maximum number of INT boards that can be plugged inside the XPS controller is 2, increasing the number of analog inputs (ADC) from 4 to 8.

**Prototype**

```c
int GPIOAnalogGainGet(
    int SocketID,
    int NbElements,
    char * GPIONameList,
    double * AnalogGainValueArray
);
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the "TCP_ConnectToServer" function.
- **NbElements**
  - int
  - Number of analog GPIO to read.
- **GPIONameList**
  - char *
  - List of analog input names – separator is comma.

**Output parameters**

- **AnalogGainValueArray**
  - int *
  - Value of analog input gain.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-22:** Not allowed action.
### 7.2.1.65 GPIOAnalogGainSet

**Name**

**GPIOAnalogGainSet** – Sets a gain for one or several analog inputs (ADC).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks board: (-8)
- GPIO name (ADC): (-8)
- Checks output value (1, 2, 4 or 8): (-17)
- Hardware compatibility or XPS initialization in progress: (-22)

**Description**

Sets a gain value for one or several analog inputs.

The gain value can be 1, 2, 4 or 8

If the conversion of the gain value to bits fails then (-22) error is returned.

The maximum number of INT boards, that can be plugged inside the XPS controller, is 2, increasing the number of analog inputs from 4 to 8.

**Prototype**

```c
int GPIOAnalogGainSet(
    int SocketID,
    int NbElements,
    char * GPIONameList,
    int * AnalogGainValueArray
)
```

**Input parameters**

- **SocketAddress** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **NbElements** int Number of analog GPIO to read.
- **GPIONameList** char * List of analog input names – separator is comma.
- **AnalogGainValueArray** int * Value of analog input gain.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
7.2.1.66 **GPIOAnalogGet**

**Name**

**GPIOAnalogGet** – Reads one or several analog inputs (ADC) or outputs (DAC).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- GPIO name (ADC or DAC): (-8)
- Hardware compatibility or XPS initialization in progress: (-22)

**Description**

Reads one or several analog IO and returns the value(s) in an array.

---

**NOTE**

In case of multiple GPIO boards controller, don’t mix GPIO names of different boards in the same command (error -8).

**Example:**

- `GPIOAnalogGet(GPIO21.DAC1,double*,GPIO21.DAC2,double*) => 0 (OK)`
- `GPIOAnalogGet(GPIO21.DAC2,double*,GPIO42.DAC2,double*) => -8 (Error)`

**Prototype**

```c
int GPIOAnalogGet(
    int SocketID,
    int NbElements,
    char * GPIONameList,
    double * AnalogValueArray
)
```

**Input parameters**

- **SocketID** int – Socket identifier gets by the “TCP_ConnectToServer” function.
- **NbElements** int – Number of analog GPIO to read.
- **GPIONameList** char * – List of analog GPIO names separated with a comma.

**Output parameters**

- **AnalogValueArray** double * – Analog GPIO value array (DAC or ADC).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-22**: Not allowed action.
### 7.2.1.67  GPIOAnalogRangeConfigurationGet

**Name**

`GPIOAnalogRangeConfigurationGet` – Gets GPIO DAC range configuration for analog output (DAC).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the GPIO type is DAC: (-8)

**Description**

This API returns the DAC range value.

**Prototype**

```c
int GPIOAnalogRangeConfigurationGet(
    int SocketID,
    char * GPIOName,
    double * DACRange
);
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GPIOName**  
  char *  
  GPIO name.

**Output parameters**

- **DACRange**  
  double *  
  DAC range value.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.

- **-8:**  
  Wrong object type for this command.
7.2.1.68  **GPIOAnalogRangeConfigurationSet**

**Name**

**GPIOAnalogRangeConfigurationSet** – Sets GPIO DAC range configuration for analog output (DAC).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the GPIO type is DAC: (-8)

**Description**

This API sets the DAC range value. Set values are:

- Input value = 0 = > Disabled
- Input value ≥ 12.0 V = > DAC range = 12.288 V
- Input value ∈ [10.0 , 12.0] = > DAC range = 10 V
- Input value ∈ [5.0 , 10.0] = > DAC range = 5 V

**Prototype**

```c
int GPIOAnalogRangeConfigurationSet(
    int SocketID,
    char * GPIOName,
    double DACRange
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GPIOName**
  - char *
  - GPIO name.
- **DACRange**
  - double
  - DAC range value.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
### 7.2.1.69 GPIOAnalogSet

#### Name

**GPIOAnalogSet** – Sets one or several analog outputs (DAC).

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the GPIO type is DAC: (-8)
- Checks input parameters number: (-17)

#### Description

Sets analog value array for DAC type of GPIO.

---

**NOTE**

In case of multiple GPIO boards controller, don’t mix GPIO names of different boards in the same command (error -8).

**Example:**

- GPIOAnalogSet(GPIO21.DAC1,5.06,GPIO21.DAC2,3.01) => 0 (OK)
- GPIOAnalogSet(GPIO21.DAC2,5.08,GPIO42.DAC2,4.02) => -8 (Error)

---

#### Prototype

```c
int GPIOAnalogSet(  
    int SocketID,  
    int NbElements,  
    char * GPIONameList,  
    double * AnalogValueArray  
)
```

#### Input parameters

- **SocketID** `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **NbElements** `int` Number of analog GPIO to read.
- **GPIONameList** `char *` List of analog GPIO names separated with a comma.
- **AnalogGainValueArray** `double *` Analog GPIO value array (DAC or ADC).

#### Output parameters

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Not allowed action.
- **-22:** Not allowed action.
7.2.1.70  GPIODigitalGet

Name
GPIODigitalGet – Reads one digital input or output.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- GPIO name (DI or DO): (-8)
- Hardware compatibility or XPS initialization in progress: (-22)

Description
Returns the value of digital input (DI) or digital output (DO).

Prototype
```c
#include <stdio.h>

int GPIODigitalGet(  
    int SocketID,  
    char * GPIOName,  
    unsigned int * DigitalValue
)
```

Input parameters
- SocketID  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- GPIOName  
  char *  
  Digital GPIO name (maximum size = 250).

Output parameters
- DigitalValue  
  unsigned short *  
  Digital GPIO value (DI or DO).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0:  
  No error.
- -8:  
  Wrong object type for this command.
- -22:  
  Not allowed action.
7.2.1.71 GPIODigitalSet

Name
GPIODigitalSet – Sets one digital output.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- GPIO name (DO): (-8)
- Hardware compatibility or XPS initialization in progress: (-22)

Description
Sets the value of the selected digital output (DO).

Prototype
int GPIODigitalSet(
    int SocketID,
    char * GPIOName,
    unsigned short Mask,
    unsigned short DigitalOutputValue
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GPIOName char * Digital GPIO name (maximum size = 250).
Mask unsigned short Mask.
DigitalOutputValue unsigned short Digital output value.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -22: Not allowed action.
7.2.1.72  GPIODigitalPulseWidthGet

Name
GPIODigitalPulseWidthGet – Reads current GPIO digital I/O pulse width.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks GPIO name and type (must be Digital I/O): (-8)

Description
This function reads the current GPIO digital I/O pulse width defined in microseconds.

Prototype
int GPIODigitalPulseWidthGet(
    int SocketID,
    char GPIOName,
    double * PulseWidth
)

Input parameters
SocketID        int    Socket identifier gets by the TCP_ConnectToServer” function.
GPIOName        int    GPIO digital I/O name.

Output parameters
PulseWidth      double * Current GPIO pulse width (µsec).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.73  **GPIODigitalPulseWidthSet**

**Name**
GPIODigitalPulseWidthSet – Sets GPIO digital I/O pulse width (µsec).

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks GPIO name and type (must be Digital I/O): (-8)

**Description**
This function configures the GPIO digital I/O pulse width defined in microseconds.

**Prototype**

```c
int GPIODigitalPulseWidthSet(
    int SocketID,
    char GPIOName,
    double PulseWidth
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the `TCP_ConnectToServer` function.
- **GPIOName** int: GPIO digital I/O name.
- **PulseWidth** double: GPIO digital I/O pulse width (µsec).

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.74 GroupAccelerationCurrentGet

**Name**

GroupAccelerationCurrentGet – Gets the current acceleration for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type: (-8)
- Checks positioner name: (-18)
- Checks group name: (-19)

**Description**

Gets the current acceleration for one or all positioners of the selected group.

**Prototype**

```c
int GroupAccelerationCurrentGet(
    int SocketID,
    char * GroupName[250],
    int NbPositioners,
    double * CurrentAcceleration
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group or positioner name.
- **NbPositioners**: int Number of positioners in the group.

**Output parameters**

- **CurrentAcceleration**: double * Current acceleration array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner name doesn't exist or unknown command.
- -19: Group name doesn't exist or unknown command.
7.2.1.75 **GroupAccelerationSetpointGet**

**Name**

*GroupAccelerationSetpointGet* – Gets the setpoint acceleration for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

Returns the setpoint acceleration for one or all positioners of the selected group.

**Prototype**

```c
int GroupAccelerationSetpointGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * SetpointAcceleration
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **NbPositioners** int Number of positioners in the selected group.

**Output parameters**

- **SetpointAcceleration** double * Setpoint Acceleration array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: GroupName doesn't exist or unknown command.
7.2.1.76 GroupAnalogTrackingModeDisable

Name

GroupAnalogTrackingModeDisable - Exits the analog tracking mode.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group name: (-19)
- Group status must be “ANALOG TRACKING”: (-22)

Description

Disables the analog tracking mode.
The group exits the “ANALOG TRACKING” state returning to “READY” state.
If the group state is not “ANALOG TRACKING”, (-22) error is returned.

NOTES

The tracking mode interprets ADC value as a position command or as a velocity command.
To enable the analog tracking mode use “GroupAnalogTrackingModeEnable” function.

Prototype

int GroupAnalogTrackingModeDisable(
    int SocketID,
    char * GroupName
)

Input parameters

SocketID int Socket identifier gets by the
          “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -9: Wrong number of parameters in the command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.77  **GroupAnalogTrackingModeEnable**

**Name**

*GroupAnalogTrackingModeEnable* - Enables the analog tracking mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids tracking type ("Position" or "Velocity"): (-8)
- Invalid group name: (-19)
- Group status must be “READY”: (-22)
- Configured tracking: (-22)

**Description**

Enables the analog tracking mode. To use this function, the group must be in READY state and tracking must be configured before, otherwise an error (-22) is returned.

Once the tracking mode is enabled, the group status must be “ANALOG TRACKING” (48 is the code for Analog tracking state due to a TrackingEnable command).

**“Position” analog tracking**

In case of “Position” tracking type, the analog input is interpreted as a position command. The parameters must be set by “AnalogTrackingPositionParametersSet” function and can be read by “AnalogTrackingPositionParametersGet” function.

**“Velocity” analog tracking**

In case of “Velocity” tracking type, the analog input is interpreted as a velocity command. The parameters must be set by “AnalogTrackingVelocityParametersSet” function and can be read by “AnalogTrackingVelocityParametersGet” function.

---

**NOTE**

To disable the analog tracking mode use “GroupAnalogTrackingModeDisable” function.

**Prototype**

```c
int GroupAnalogTrackingModeEnable(
    int SocketID,
    char * GroupName,
    char * Type
)
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**  
  char *  
  Group name.
- **Type**  
  char *  
  Tracking type (“Position” or “Velocity”).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -9: Wrong number of parameters in the command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.78 **GroupBrakeStateGet** [Extended]

**Name**

*GroupBrakeStateGet* – Gets current brake command state.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if GPIO board number: (-17)
- Checks if GPIO board is present: (-100)
- Checks if “Brake” mode is enabled: (-205)

**Description**

This function reads the current brake command signal state from Inhibit or GPIO connector. Refer to section [BRAKE] in System.ini configuration file. The feature is developed to avoid a run away after hardware error detection (XY group only).

Brake command signal:

1) BrakeCommandSignalState parameter is defined “Direct” in System.ini
   - 0 = Brake OFF.
   - 1 = Brake ON.

2) BrakeCommandSignalState parameter is defined “Inverted” in System.ini
   - 0 = Brake ON.
   - 1 = Brake OFF.

**Prototype**

```c
int GroupBrakeStateGet(
    int SocketID,
    char * GroupName,
    int * BrakeCommand,
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name (XY).

**Output parameters**

- **BrakeCommand**
  - int *
  - Brake command (0 or 1).

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -205: Not enable in your configuration.
- -100: Internal error (memory allocation error …).
7.2.1.79  **GroupBrakeSet [Extended]**

**Name**

*GroupBrakeSet* – Sets brake command.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks GPIO board number / Checks brake command value: (-17)
- Checks if GPIO board is present: (-100)
- Checks if “Brake” mode is enabled: (-205)

**Description**

This function sets brake command signal from Inhibit or GPIO connector. Refer to section [BRAKE] in System.ini configuration file. The feature is developed to avoid a run away after hardware error detection (XY group only).

Brake commands:

1) BrakeCommandSignalState parameter is defined “Direct” in System.ini
   - 0 = Brake OFF.
   - 1 = Brake ON.

2) BrakeCommandSignalState parameter is defined “Inverted” in System.ini
   - 0 = Brake ON.
   - 1 = Brake OFF.

**Prototype.**

```c
int GroupBrakeSet(
    int SocketID,
    char * GroupName,
    int BrakeCommand,
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the TCP_ConnectToServer function.
- **GroupName** char * Group name (XY).
- **BrakeCommand** int Brake command (0 or 1).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -205: Not enable in your configuration.
- -100: Internal error (memory allocation error …).
7.2.1.80  **GroupCorrectorOutputGet**

**Name**

**GroupCorrectorOutputGet** – Gets corrector output for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Returns corrector output for one or all positioners of the selected group.

The input parameter “group name” can be a positioner name.

For a group, this function returns the corrector output for each positioner from the selected group.

For a positioner, this function returns only the corrector output associated with the selected positioner.

**Prototype**

```c
int GroupCorrectorOutputGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * CorrectorOutput
)
```

**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**: char *  
  Group name.

- **NbPositioners**: int  
  Number of positioners in the selected group (1 if positioner).

**Output parameters**

- **CorrectorOutput**: double *  
  Corrector output array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**:  
  No error.
7.2.1.81 GroupCurrentFollowingErrorGet

Name
GroupCurrentFollowingErrorGet – Gets the current following error for one or all positioners of the selected group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
Returns the current following error for one or all positioners of the selected group.

Prototype
int GroupCurrentFollowingErrorGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * CurrentFollowingError
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
NbPositioners int Number of positioners in the selected group (1 if positioner).

Output parameters
CurrentFollowingError double * Current following error array.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.82 **GroupExternalProfilerDisable**

**Name**

*GroupExternalProfilerDisable* – Stops and disables the external profile generator.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid group name: (-19)
- Group status must be “EXTERNAL PROFILER ENABLED”: (-22)

**Description**

Stops and disables the external profile generator. To use this function, the group must be in “EXTERNAL PROFILER ENABLED” state and all positioners must be idle (i.e. velocity equal to 0).

This function exits the “EXTERNAL PROFILER ENABLED” state and returns to “READY” state.

If the group state is not in “EXTERNAL PROFILER ENABLED” state, or the profiler velocity is not null, error (-22) is returned.

---

**NOTE**

To enable the external profile generator, use “GroupExternalProfilerEnable” function.

---

**CAUTION**

The external profile generator can be used only with TZ group.

---

**Prototype**

```c
int GroupExternalProfilerDisable (  
    int SocketID,  
    char * GroupName  
)
```

**Input parameters**

- **SocketID** `int` – Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** `char *` – Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** GroupName doesn't exist or unknown command.
- **-22:** Not allowed action.
7.2.1.83 **GroupExternalProfilerEnable**

**Name**

*GroupExternalProfilerEnable* – Enables and starts the external profile generator.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8), (-18)
- Invalid group name: (-19)
- Group status must be “READY”: (-22)
- Backlash must not be activated: (-46)

**Description**

Enables and starts the external profile generator. To use this function, the group must be in “READY” state and all positioners must be idle (i.e velocity equal to 0).

This function enters “EXTERNAL PROFILER ENABLED” state.

If the group state is not “READY”, (-22) error is returned.

**NOTE**

To disable the external profile generator, use the “*GroupExternalProfilerDisable*” function.

**CAUTION**

The external profile generator can be used only with TZ group.

**Prototype**

```c
int GroupExternalProfilerEnable (  
    int SocketID,  
    char * GroupName  
)
```

**Input parameters**

- **SocketID**
  - int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *: Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.1.84 GroupGantryModeGet [Extended]

Name
GroupGantryModeGet – Gets current gantry option.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the set option mode (Option0, Option1 or Option2): (-17)
- Checks the group name is valid (must be XY group): (-19)
- Checks gantry mode getting is allowed: (-22)
- Checks if XY dual gantry mode is enabled: (-205)

Description
Gets the current gantry option. This function is allowed only with a Gantry XY group.
Three “Gantry” options are available:
- **Option0** = >Gantry standard.
- **Option1** = >Gantry force balance.
- **Option2** = >Gantry force balance with dual encoder.

Refer to XY group section from system.ini file to enable “XYDualMode” and to configure it.

Prototype
int GroupGantryModeGet(
    int SocketID,
    char * GroupName,
    char * Option
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * XY group name.

Output parameters
Option char * Option0, Option1 or Option2.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -205: Not enable in your configuration.
### 7.2.1.85 GroupGantryModeSet [Extended]

**Name**

GroupGantryModeSet – Sets gantry option.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the user option value (Option0, Option1 or Option2): (-17)
- Checks the group name (must be XY group): (-19)
- Checks if the gantry mode getting is allowed: (-22)
- Checks the current gantry option: (-201)
- Checks if XY Dual Gantry mode is enabled: (-205)

**Description**

Sets the gantry option. It’s possible to configure the gantry option only when the XY group is in “READY” or “DISABLE” state.

Three “Gantry” options are available:

- **Option0** = >Gantry standard.
- **Option1** = >Gantry force balance.
- **Option2** = >Gantry force balance with dual encoder.

Refer to XY group section from system.ini file to enable “XYDualMode” and to configure it.

**Prototype**

```c
int GroupGantryModeSet(  
    int SocketID,  
    char * GroupName,  
    char * Option  
)
```

**Input parameters**

- **SocketID**: int
  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**: char *
  
  XY group name.

- **Option**: char *
  
  Option0, Option1 or Option2.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-17**: Parameter out of range or incorrect.
- **-19**: GroupName doesn’t exist or unknown command.
- **-22**: Not allowed action.
- **-201**: The group is already in this mode.
- **-205**: Not enable in your configuration.
7.2.1.86 GroupGoToNotReferenced

Name
GroupGoToNotReferenced – Change group status to NOTREF.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group name (must be a XY): (-19)
- Group status must be "READY": (-22)

Description
Change group status from READY to NOTREF.
If the current group status is not in “READY” state, error (-22) is returned.

NOTE
This command is effective only for XY group.

Prototype
int GroupGoToNotReferenced ( int SocketID,

char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the "TCP_ConnectToServer" function.

GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.87  **GroupHomeSearch**

**Name**

*GroupHomeSearch* - Initiates a home search.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- The actor must be a valid group name: (-19)
- Group status must be "Not referenced": (-22)

**Description**

This function initiates a home search for each positioner of the selected group. The group must be initialized and in “NOT REFERENCED” state otherwise error (-22) is returned.

The home search can fail due to:

- a following error: (-25).
- a ZM detection error: (-49).
- a motion done time out, when a dynamic error of the positioner is detected during home search process (-33).
- a home search timeout, when the complete (and complex) home search procedure was not executed in the allowed time: (-28).
- a home search index error in case of XY group: (-86).

For all these errors, the group returns to “NOTINIT” state.

After the home search sequence, each positioner error is checked. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is always present, (-35) error is returned and the group becomes “NOTINIT”.

Once the home search is successful, the group is in “READY” state.

---

**NOTES**

The home search routine for each positioner is defined in “stages.ini” file by “HomeSearchSequenceType” parameter.

The homesearch time out is defined in “stages.ini” file by “HomeSearchTimeOut” parameter.

The home search sequence is defined in “system.ini” file by “InitializationAndHomeSearchSequence” parameter for each group with several positioners.

**XY group**

The home search sequence can be “Together”, “XthenY” or “YthenX” in a standard XY configuration.

If the XY group is “Gantry” (dual positioner on X or on Y axis) only “XthenY” or “YthenX” are allowed.

**XYZ group**

The home search sequence can be “Together” or “XthenYthenZ”.

**MultipleAxes group**

The home search sequence can be “Together”, “OneAfterAnother” or “OneAfterAnotherInReverseOrder”.

---
If the `MultipleAxes` group has at least one “Gantry” positioner (dual positioner on one axis or some axes) only “OneAfterAnother” or “OneAfterAnotherInReverseOrder” is allowed.

**Prototype**

```c
int GroupHomeSearch(  
    int SocketID,  
    char * GroupName  
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -28: Home search timeout.
- -33: Motion done timeout.
- -35: Position is outside of travel limits.
- -49: Inconsistent mechanical zero during home search.
7.2.1.88  GroupHomeSearchAndRelativeMove

Name
GroupHomeSearchAndRelativeMove - Initiates a home search followed by a relative move.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group name: (-19)
- Group status must be "Not referenced": (-22)

Description
This function initiates a home search followed by a relative move at the end of the home search.

The group must be initialized and in “NOT REFERENCED” state otherwise (-22) error is returned.

If there is no error, the group status changes to “HOMING”.

The home search sequence can fail due to:
- a following error: (-25).
- a ZM detection error: (-49).
- a home search time out: (-33).

For all these errors, the group returns to “NOTINIT” state.

Once the home search is completed, a relative move is executed. After this sequence each positioner is checked for error. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is always present, ERR_TRAVEL_LIMITS (-35) is returned and the group status becomes “NOTINIT”.

If the home search is successful, the group will be in “READY” state.

NOTES

The home search routine for each positioner is defined in stages.ini file by “HomeSearchSequenceType” parameter.

The home search time out is defined in stages.ini file by “HomeSearchTimeOut” parameter.

The home search sequence is defined in system.ini file by “InitializationAndHomeSearchSequence” parameter for each group with several positioners:

XY group
The home search sequence can be “Together”, “XthenY” or “YthenX” if the XY group is standard configuration. If the XY group is Gantry (dual positioner on X or on Y axis) only the “XthenY” or “YthenX” are allowed.

XYZ group
The home search sequence can be “Together” or “XthenYthenZ”.

MultipleAxes group
The home search sequence can be “Together”, “OneAfterAnother” or “OneAfterAnotherInReverseOrder”.

If the MultipleAxes group has at least one “Gantry” positioner (dual positioner on one axis or some axes), only “OneAfterAnother” or “OneAfterAnotherInReverseOrder” are allowed.
Prototype

```c
int GroupHomeSearchAndRelativeMove(
    int SocketID,
    char * GroupName
)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -28: Home search timeout.
- -33: Motion done timeout.
- -35: Position is outside of travel limits.
- -49: Inconsistent mechanical zero during home search.
7.2.1.89 GroupInitialize

Name

GroupInitialize - Initializes the motor and activates the servo loop of the selected group.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)
- Group status must be "NOTINIT": (-22)
- Checks state of physical ends of run: (-113)

Description

The selected group must be in not initialized “NOTINIT” state, otherwise (-22) error is returned.

This function begins to check the positioner error. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is always present, the motor is turned off, (-5) error is returned and the group state becomes “NOTINIT”.

If there is no positioner error, then the group status becomes “MOTOR_INIT”. The master-slave error is cleared, the encoder is reset (update encoder position) and the user travel limits are checked.

If a travel limit error is detected then the motor is turned off, the error (-35) is returned and the group state becomes “NOTINIT”.

Moreover, the function checks the state of the physical ends of run. If both physical ends of run are activated, then the motor is turned off, the error (-113) is returned and the group state becomes “NOTINIT”.

If no error detected, the motor is initialized in case of “AnalogSinAcc” or “AnalogDualSinAcc”. The error (-50) is returned, if the initialization failed and the group state becomes “NOTINIT”.

If successful, the positions are reset, the servo loop is activated and the motor is on. The group is now in “NOT REFERENCED” state.

NOTES

In Master-Slave mode, after an emergency stop, the master group and the slave group are in “NOTINIT” state.

To restart a master-slave relation the slave group(s) must be reinitialized before the master group.
Prototype

```c
int GroupInitialize(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**: `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: `char *` Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-5**: Not allowed due to a positioner error or hardware status.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-35**: Position is outside of travel limits.
- **-50**: Motor initialization error. Check InitializationAccelerationLevel, ScalingAcceleration, MaximumJerkTime, EncoderResolution or EncoderScalePitch.
- **-113**: Both ends of run activated.
7.2.1.90 **GroupInitializeNoEncoderReset**

**Name**

*GroupInitializeNoEncoderReset* - Initializes the motor without encoder reset and activates the servo loop of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)
- Group status must be "NOTINIT": (-22)
- Checks state of physical ends of run: (-113)

**Description**

The selected group must be in “NOTINIT” state, otherwise (-22) error is returned. This function begins to check the positioner error. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is always present, the motor is turned off, (-5) error is returned and the group state becomes “NOTINIT”.

If there is no positioner error, then the group status becomes “MOTOR_INIT”. The master-slave error is cleared, the encoder is reset (update encoder position) and the user travel limits are checked. If a travel limit error is detected then the motor is turned off, the error (-35) error is returned and the group becomes “NOTINIT”.

Moreover, the function checks the state of the physical ends of run. If both physical ends of run are activated, then the motor is turned off, the error (-113) error is returned and the group state becomes “NOTINIT”.

If no error detected, the motor is initialized in case of “AnalogSinAcc” or “AnalogDualSinAcc”. The error (-50) is returned if the initialization has failed and the group state becomes “NOTINIT”.

If successful, the positions are not reset, the servo loop is activated and the motor is on. The group is now in “NOT REFERENCED” state.

---

**NOTES**

In Master-Slave mode, after an emergency stop, the master group and the slave group are in “NOTINIT” state.

To restart a master-slave relation the slave group(s) must be reinitialized before the master group.

**Prototype**

```c
int GroupInitializeNoEncoderReset(  
    int SocketID,  
    char * GroupName  
)  
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
</tbody>
</table>
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -5: Not allowed due to a positioner error or hardware status.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -35: Position is outside of travel limits.
- -113: Both ends of run activated.
7.2.1.91 **GroupInitializeWithEncoderCalibration**

**Name**

*GroupInitializeWithEncoderCalibration* - Initializes motor, calibrates encoder and activates servo loop.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)
- Group status must be "NOTINIT": (-22)
- Checks state of physical ends of run: (-113)

**Description**

If the selected group is not in “NOTINIT” state, error (-22) is returned.

Initializes the motor, calibrates the encoder and activates the servo loop of each positioner of the selected group. To get the calibration results for each positioner, use the “PositionerEncoderCalibrationParametersGet” function.

This function checks the positioner error. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is always present, the motor is turned off, (-5) error is returned and the group state becomes “NOTINIT”.

If no positioner error detected, then the group status becomes “MOTOR_INIT”. The master-slave error is cleared, the encoder is reset (update encoder position) and the user travel limits are checked. If a travel limit error is detected then the motor is turned off, the error (-35) is returned and the group state becomes “NOTINIT”.

Moreover, the function checks the state of the physical ends of run. If both physical ends of run are activated, then the motor is turned off, the error (-113) is returned and the group state becomes “NOTINIT”.

If no error detected, the motor is initialized in case of “AnalogSinAcc” or “AnalogDualSinAcc”. The error (-50) is returned if the initialization has failed and the group state becomes “NOTINIT”.

After the group initialization the group status is “MOTOR_INIT”, next the encoder undergoes calibration and the group status becomes “ENCODER_CALIBRATING”. If a following error occurs during calibration, (-25) error is returned and the group state becomes “NOTINIT”.

If successful, the motor is initialized, the encoder is calibrated and the servo loop is activated. The group is now in “NOT REFERENCED” state.

---

**NOTE**

In Master-Slave mode, after an emergency stop, the master group and the slave group are in “NOTINIT” status.
To restart a master-slave relation the slave group(s) must be reinitialized before the master group.
Prototype

```c
int GroupInitializeWithEncoderCalibration(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -5: Not allowed due to a positioner error or hardware status.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -35: Position is outside of travel limits.
- -113: Both ends of run activated.
7.2.1.92  **GroupInterlockDisable [Extended]**

**Name**

**GroupInterlockDisable** – Disables group interlock mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)

**Description**

This function removes the dependency between a group and the groups that are included in GroupInterlock mode. So, when it is executed, the group can initialize, home or move independent of all errors coming from other interlocked groups.

**GroupInterlock mode**: Actions that a group takes based on the activities of other groups: execute actions (like stop axis, power-off, change state…) immediately after an error (or an user command Disable/KillGroup) detected from one of its interlocked groups.

**Example**: The list of interlocked groups is G1, G2, G3, this means:

- G1 depends on G2 and G3 (G1 in action if an error occurs on G2 or G3)
- G2 depends on G1 and G3 (G2 in action if an error occurs on G1 or G3)
- G3 depends on G1 and G2 (G3 in action if an error occurs on G1 or G2)

The interlocked groups are listed in the [GROUPS] section of system.ini file: 

```
InterlockedGroups = … ; Names of groups involved in the GroupInterlock mode.
```

The GroupInterlock mode is enabled by default at boot of the XPS controller.

**Prototype**

```
int GroupInterlockDisable(  
    int SocketID,        
    char * GroupName 
 )
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.1.93  **GroupInterlockEnable**  [Extended]

**Name**

GroupInterlockEnable – Enables group interlock mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)

**Description**

This function enables the dependency between a group and the groups that are involved in GroupInterlock mode. So, if this function executes, the group cannot initialize, home or move without correcting the errors coming from its interlocked groups.

**GroupInterlock mode**: Activities that a group takes are dependant on the activities of other groups. For example, execute actions like stop axis, power-off, change state immediately after an error or Disable/KillGroup command sent by user detected from one of its interlocked groups.

**Example**: The list of interlocked groups is G1, G2, G3, this means:

- G1 depends on G2 and G3 (G1 in action if an error occurs on G2 or G3)
- G2 depends on G1 and G3 (G2 in action if an error occurs on G1 or G3)
- G3 depends on G1 and G2 (G3 in action if an error occurs on G1 or G2).

The interlocked groups are listed in the [GROUPS] section of system.ini file:

```
InterlockedGroups = …; Names of groups involved in the GroupInterlock mode.
```

The GroupInterlock mode is enabled by default at boot of the XPS controller.

**Prototype**

```c
int GroupInterlockEnable(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *  
  Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.94 GroupJogCurrentGet

**Name**

GroupJogCurrentGet – Gets the current velocity and acceleration from the jog profiler.

---

**CAUTION**

The jog mode cannot be used with a spindle group.

---

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

This function returns the current velocity and acceleration from the jog profiler for one positioner or for all positioners of the selected group. It must be called when the group is in “JOGGING” mode, otherwise the returned current velocity and current acceleration values will be null.

**Prototype**

```c
int GroupJogCurrentGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * Velocity,
    double * Acceleration
)
```

**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *  
  Group name.
- **NbPositioners**: int  
  Number of positioners in the selected group (1 if a positioner).

**Output parameters**

- **Velocity**: double *  
  Current velocity array.
- **Acceleration**: double *  
  Current Acceleration array.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.95 GroupJogModeDisable

**Name**
GroupJogModeDisable – Disables the jog mode *

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid group name: (-19)
- Group status must be “JOGGING”: (-22)

**Description**
Disables the Jog mode. To use this function, the group must be in “JOGGING” state and all positioners must be idle (i.e. velocity equal to 0).
This function exits the “JOGGING” state and returns to “READY” state.
If the group state is not in “JOGGING” state, or the profiler velocity is not null, error (-22) is returned.

---

**NOTE**
To enable the jog mode use “GroupJogModeEnable” function.

---

**CAUTION**
The jog mode cannot be used with spindle group.

---

**Prototype**
```c
int GroupJogModeDisable(
    int SocketID,
    char * GroupName
)
```

**Input parameters**
- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.1.96 GroupJogModeEnable

Name

GroupJogModeEnable – Enables the jog mode.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8), (-18)
- Invalid group name: (-19)
- Group status must be “READY”: (-22)
- Backlash must not be activated: (-46)

Description

Enables the Jog mode. To use this function, the group must be in “READY” state and all positioners must be idle (i.e. velocity equal to 0).

This function enters “JOGGING” state.

If the group state is not “READY”, (-22) error is returned.

NOTE

To disable the jog mode use the “GroupJogModeDisable” function.

CAUTION

The jog mode cannot be used with spindle group.

Prototype

int GroupJogModeEnable(
    int SocketID,
    char * GroupName
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char * Group name.

Output parameters

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -46: Not allowed action due to backlash.
7.2.1.97 GroupJogParametersGet

Name
GroupJogParametersGet – Gets the velocity and acceleration set by “GroupJogParametersSet”.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
This function returns the velocity and acceleration in jog mode set by the user for one positioner or for all positioners of the selected group.
It must be called when the group is in “JOGGING” mode, otherwise both the velocity and the acceleration will be null.
To change the velocity and the acceleration on the fly in jog mode, use “GroupJogParametersSet” function.

CAUTION
The jog mode cannot be used with spindle group.

Prototype
int GroupJogParametersGet(
    int SocketID,
    char *GroupName,
    int NbPositioners,
    double *Velocity,
    double *Acceleration
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
NbPositioners int Number of positioners in the selected group.

Output parameters
Velocity double * User jog velocity array.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.98  **GroupJogParametersSet**

**Name**

*GroupJogParametersSet* – Changes the velocity and acceleration on the fly, in jog mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be “JOGGING”: (-22)
- Input parameters for each positioner:
  - Velocity > MaximumVelocity => Velocity = MaximumVelocity
  - Velocity < -MaximumVelocity => Velocity = -MaximumVelocity
  - Acceleration ≤ 0 (-42)
  - Acceleration > MaximumAcceleration => Acceleration = MaximumAcceleration

**Description**

This function changes the velocity and acceleration in jog mode on the fly. If an error occurs, each positioner stops and the velocity value is set to zero.

To use this function, the jog mode must be enabled (requires call of the "GroupJogModeEnable" function).

If the group status is not “JOGGING”, error (-22) is returned.

If a slave or following error are detected during the jog setting, then (-25) or (-44) errors are returned. In this case, the motion is stopped, the jog mode is disabled and the group status becomes “DISABLE”.

**CAUTION**

The jog mode cannot be used with spindle group.

**Prototype**

```c
int GroupJogParametersSet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double Velocity,
    double Acceleration
)
```
**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**  
  char *  
  Group name.

- **NbPositioners**  
  int  
  Number of positioners in the selected group.

- **Velocity**  
  double  
  User jog velocity array.

- **Acceleration**  
  double  
  User jog Acceleration array.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -42: Jog value out of range.
- -44: Slave error disabling master.
7.2.1.99 GroupKill

Name
GroupKill - Kills the selected group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8), (-18)
- Invalid group name: (-19)

Description
Kills the selected group to stop its action. The group returns to “NOTINIT” state. If the group is already in this state then it stays there.
The GroupKill is a high priority command that is executed in any condition.

NOTE
If an initialization, encoder calibration, homing, referencing, motion or trajectory process is in progress, an “emergency stop” will be executed. Error (-26) will be generated, for each of these functions.

Prototype
int GroupKill(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.100 GroupMotionDisable

Name
GroupMotionDisable – Disables a “READY” group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)
- Group status must be "READY": (-22)

Description
Turns OFF the motors, stops the corrector servo loop and disables the position compare mode, if active. The group status becomes “DISABLE”.
If the group is not in “READY” state, error (-22) is returned.

NOTE
In the “DISABLED” state the encoder is still read.
To return to “READY” state, call “GroupMotionEnable” function.

Prototype

```
int GroupMotionDisable(
    int SocketID,
    char * GroupName
)
```

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.101 **GroupMotionEnable**

**Name**

*GroupMotionEnable* – Enables a group in DISABLE state to turn the motors on and to restart corrector loops.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Actor must be a group: (-8), (-18)
- Invalid group name: (-19)
- Group status must be "DISABLE": (-22)

**Description**

Turns ON the motors and restarts the corrector servo loops. The group state becomes “READY”. If the group is not in “DISABLE” error (-22) is returned.

**Prototype**

```c
int GroupMotionEnable(  
    int SocketID,  
    char * GroupName  
)
```

**Input parameters**

- **SocketID** int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *  
  Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  
  No error.
- -8:  
  Wrong object type for this command.
- -18:  
  Positioner Name doesn't exist or unknown command.
- -19:  
  GroupName doesn't exist or unknown command.
- -22:  
  Not allowed action.
7.2.1.102 GroupMotionStatusGet

Name

GroupMotionStatusGet – Gets the motion status for one or all positioners of the selected group.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description

Returns the motion status for one or all positioners of the selected group.
The motion status possible values are:
0: Not moving state (group status in NOT_INIT, NOT_REF or READY).
1: Busy state (positioner in moving, homing, referencing, spinning, analog tracking, trajectory, encoder calibrating, slave mode).

Prototype

int GroupMotionStatusGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    int * Status
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
NbPositioners int Number of positioners in the selected group.

Output parameters

Status int * Positioner status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.103 GroupMoveAbort

Name

GroupMoveAbort – aborts the motion or the jog in progress for a group or a positioner.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be "MOVING" or “JOGGING”: (-22)

Description

This function aborts a motion or a jog in progress. The group state must be "MOVING" or "JOGGING", otherwise error (-22) is returned.

For a group:

If the group status is “MOVING”, this function stops all motion in progress.
If the group status is “JOGGING”, this function stops all “jog” motions in progress and disables the jog mode. After this "group move abort" action, the group status becomes "READY".

For a positioner:

If the group status is “MOVING”, this function stops the motion of the selected positioner.
If the group status is “JOGGING”, this function stops the “jog” motion of the selected positioner.
If the positioner is idle, an error (-22) is returned.

After “positioner move abort” action, if all positioners are idle, the group status changes to "READY", otherwise it stays in the same state.

NOTE

If the “move abort” action fails, error (-27) is returned.
This error is generated when GroupMoveAbort is used to abort a motion of a positioner in a group and the name of the positioner is incorrect.
This error will also be returned by “GroupMove” function.

Prototype

```c
int GroupMoveAbort(
    int SocketID,
    char * GroupName
)
```

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -27: Move Aborted.
### 7.2.1.104 GroupMoveAbortFast [Extended]

**Name**

**GroupMoveAbortFast** – aborts with user-defined deceleration a motion or a jog in progress for a group or positioner.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Vals UserDecelerationMultiplier value (≥1 and ≤100): (-17)
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be "MOVING" or “JOGGING”: (-22)

**Description**

This function aborts a motion or a jog in progress with a deceleration value defined by user (UserDeceleration):

\[
\text{UserDeceleration} = \text{DecelerationMultiplier} \times \text{MaximumAcceleration}.
\]

Here: DecelerationMultiplier: GroupMoveAbortFast function parameter

MaximumAcceleration: Stage parameter, defined in the stages.ini file.

The group state must be "MOVING" or "JOGGING", otherwise error (-22) is returned.

**For a group:**

If the group state is "MOVING", this function stops all motion.

If the group state is "JOGGING", this function stops all "jog" motion and disables the jog mode. After this "group move abort" action, the group state becomes "READY".

**For a positioner:**

If the group state is "MOVING", this function stops the motion of the selected positioner.

If the group state is "JOGGING", this function stops the "jog" motion of the selected positioner.

If the positioner is idle, error (-22) is returned.

After "positioner move abort" action, if all positioners are idle, the group state becomes "READY", otherwise it stays the same.

---

**NOTE**

If the “move abort” action fails, error (-27) is returned.

**Prototype**

```c
int GroupMoveAbortFast(
    int SocketID,
    char * GroupName
)
```
### Input parameters

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *  
  Group name.
- **DecelerationMultiplier**: int  
  Braking deceleration multiplier.

### Output parameters

None.

### Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-27**: Move Aborted.
7.2.1.105 **GroupMoveAbsolute**

**Name**

*GroupMoveAbsolute* - Initiates an absolute move for a positioner or a group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Verifies target position in relation with the travel limits: (-17)
  - TargetPosition ≥ MinimumTargetPosition.
  - TargetPosition ≤ MaximumTargetPosition.
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be "READY" or "MOVING": (-22)

**Description**

This function initiates an absolute move to one or all positioners of the selected group. The group state must be “READY” or “MOVING”, otherwise error (-22) is returned. If the group is “READY” then the group state becomes “MOVING”.

An absolute motion is defined by the distance between the zero position and the target position. If the current position is the same as the target position then no move will be done.

Each “positioner” move refers to the acceleration, velocity, minimum jerkTime and maximum jerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.

If a slave or following error is detected during the move then (-25) or (-44) errors are returned. In this case, the motion in progress is stopped and the group state becomes “DISABLE”.

If the “MotionDoneMode” is defined as “VelocityAndPositionWindowMotionDone” error (-33) will be returned when the time out (defined by “MotionDoneTimeout” in the stages.ini file) is reached before the motion is done. The group state will change to “DISABLE”.

In case of “GroupMoveAbort”, error (-27) is returned. The motion in progress is stopped and the group state becomes “READY”.

During a move with PositionCompare (or TimeFlasher) scan enabled, if the current following error exceeds *WarningFollowingError* value inside the PositionCompare (or TimeFlasher) scan zone, a WarningFollowingErrorFlag is latched. In this case the motion continues and finishes normally (the group status becomes “READY”), but the *GroupMoveAbsolute* function returns (-120) error instead of SUCCESS (0). To reset WarningFollowingErrorFlag for next moves, execute PositionerPositionCompareDisable (or PositionerTimeFlasherDisable) function.

If in “GroupKill” command an emergency brake or an emergency stop has occurred, error (-26) is returned. In this case, the motion in progress is stopped and the group state becomes “NOTINIT”.

---

**NOTE**

Asynchronous moves for positioners of the same group are possible through the use of different sockets to send functions.

**Prototype**
int GroupMoveAbsolute(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * TargetPosition
)

**Input parameters**

SocketID       int          Socket identifier gets by the
                “TCP_ConnectToServer” function.
GroupName       char *       Group name.
NbPositioners   int          Number of positioners in the selected group.
TargetPosition  double *    Target position array.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -120: Warning following error during move with position compare enabled.
7.2.1.106 GroupMoveEndWait

Name
GroupMoveEndWait – Wait for the end of move (XY group only).

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group is “XY”: (-8)
- Checks expected position after motion: (-211)

Description
This function allows waiting for the true end of the move (after a GroupMoveAbsolute, GroupMoveRelative or GroupMoveSlice).
It is only available for an XY group.

Prototype
int GroupMoveEndWait(
    int SocketID,
    char * GroupName,
    double TimeOutMs,
    double XPosition,
    double YPosition
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * XY Group name.
TimeOutMs double Time out in milliseconds.
XPosition double X position to check in controller unit.
YPosition double Y position to check in controller unit.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -211: Not expected position after motion.
7.2.1.107 **GroupMoveRelative**

**Name**

`GroupMoveRelative` - Initiates a relative move for a positioner or a group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Verifies target displacement in relation with the travel limits: (-17)
  - `TargetPosition ≥ MinimumTargetPosition`.
  - `TargetPosition ≤ MaximumTargetPosition`.
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be "READY" or "MOVING": (-22)

**Description**

This function initiates a relative move defined by the target displacement to one or all positioners of the selected group. The group state must be “READY” or “MOVING”. otherwise error (-22) is returned. If the group is in “READY” state, then it turns into “MOVING”.

The target displacement and the current position define the new target position to reach:

\[
\text{NewTargetPosition} = \text{CurrentTargetPosition} + \text{TargetDisplacement}
\]

Each “positioner” move refers to the acceleration, velocity, minimum jerkTime and maximum jerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.

If a slave or following error is detected during the move then errors (-25) or (-44) are returned. In this case, the motion in progress is stopped and the group status becomes “DISABLE”.

If “MotionDoneMode” is defined as “VelocityAndPositionWindowMotionDone”, error (-33) is returned when the time out (defined by “MotionDoneTimeout” in the stages.ini file) is reached before the motion is done. The group state becomes “DISABLE”.

In case “GroupMoveAbort” is executed, error (-27) is returned. The motion in progress is stopped and the group state becomes “READY”.

During move with PositionCompare (or TimeFlasher) scan enabled, if the current following error exceeds `WarningFollowingError` value inside the PositionCompare (or TimeFlasher) scan zone, a `WarningFollowingErrorFlag` is latched. In this case the motion continues and ends normally (the group status becomes “READY”), but the `GroupMoveRelative` function returns (-120) error instead of SUCCESS (0). To reset `WarningFollowingErrorFlag` for the next moves, execute `PositionerPositionCompareDisable` (or `PositionerTimeFlasherDisable`) function.

If in “GroupKill” command an emergency brake or an emergency stop has occurred, error (-26) is returned. In this case, the motion in progress is stopped and the group state becomes “NOTINIT”.

---

**NOTE**

Asynchronous moves for positioners of a same group are possible through the use of different sockets to send the functions.
Prototype

```c
int GroupMoveRelative(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * Displacement
)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.
- **NbPositioners**: int Number of positioners in the selected group.
- **Displacement**: double * Relative displacement array.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn’t exist or unknown command.
- -19: GroupName doesn’t exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -120: Warning following error during move with position compare enabled.
7.2.1.108 GroupMoveRelativeSimulated

Name
GroupMoveRelativeSimulated – Calculate the Sgamma motion parameters for a distance of a positioner or a group without moving the positioners.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
Calculate the Sgamma motion parameters for a distance of a positioner or a group without moving the positioners.
The target displacement and the setpoint position define the new target position to reach:

\[
\text{NewTargetPosition} = \text{SetpointPosition} + \text{TargetDisplacement}
\]

Each “positioner” move refers to the acceleration, velocity, minimum jerkTime and maximum jerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.
The command can be executed in any state of the group.
After this command is executed, PositionerSGammaMoveResultGet() command can be used to get the motion parameters of the last move.

Prototype

```
int GroupMoveRelativeSimulated(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * Displacement
    )
```

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
NbPositioners int Number of positioners in the selected group.
Displacement double * Relative displacement array.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.109 GroupPositionCurrentGet

Name

GroupPositionCurrentGet – Gets the current position for one or all positioners of the
selected group.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description

Returns the current position for one or all positioners of the selected group.

The current position is defined as:

\[ \text{CurrentPosition} = \text{SetpointPosition} - \text{FollowingError} \]

Examples of use in a Terminal with an XY group:

For a positioner (example with an XY group):
- GroupPositionCurrentGet(XY.X, double *)
- Gantry system: GroupPositionCurrentGet(XY.X.SecondaryPositioner, double *)

For a group (example with an XY group):
- GroupPositionCurrentGet(XY, double *, double *, double *, double *, double *)

Description [HXP-D only]

Function used with a GroupName:

This function returns the CurrentPosition for all actuators (Hexapod.1 to Hexapod.6)
of the selected hexapod group.

The current position of Hexapod.1 to Hexapod.6 is defined as:

\[ \text{CurrentPosition} = \text{SetpointPosition} - \text{FollowingError} \]

Function used with a PositionerName:

1) This function returns the CurrentPosition for one positioner (an Hexapod actuator
position) if PositionerName is:
   - Hexapod.1
   - Hexapod.2
   - Hexapod.3
   - Hexapod.4
   - Hexapod.5
   - Hexapod.6

2) This function returns the X, Y, Z, U, V or W coordinate of the Hexapod platform
   (the position of the Tool coordinate system in the Work coordinate system) if
   PositionerName is:
   - Hexapod.X
   - Hexapod.Y
   - Hexapod.Z
   - Hexapod.U
   - Hexapod.V
   - Hexapod.W

Examples of use in a Terminal with an “HXP” Hexapod group:

For an Hexapod group = current positions of Hexapod.1 to Hexapod.6 actuators only:
- GroupPositionCurrentGet(HXP,double*,double*,double*,double*,double*,double*)

For an Hexapod positioner :
- GroupPositionCurrentGet(HXP.1, double*) = current position of Hexapod.1 actuator
- GroupPositionCurrentGetGet(HXP.X, double*) = current coordinate X of Tool in Work
NOTE [HXP-D only]
Use the “HexapodPositionCurrentGet” function to get X, Y, Z, U, V, W coordinates system position of Tool in Work for an Hexapod group.

Prototype

```c
int GroupPositionCurrentGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * CurrentPosition
)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name or Positioner name.
- **NbPositioners**: int Number of positioners in the selected group.

Output parameters

- **CurrentPosition**: double * Current position array.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.110 GroupPositionSetpointGet

**Name**

*GroupPositionSetpointGet* – Gets the setpoint position for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

Returns the setpoint position for one or all positioners of the selected group. The “setpoint” position is calculated by the motion profiler and represents the “theoretical” position to reach.

**NOTE [HXP-D only]**

Use the “HexapodPositionSetpointGet” function to get X, Y, Z, U, V, W coordinates system position of Tool in Work for an Hexapod group.

**Prototype**

```c
int GroupPositionSetpointGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * SetpointPosition
);
```

**Input parameters**

- **SocketID**
  
  int Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**
  
  char * Group name.

- **NbPositioners**
  
  int Number of positioners in the selected group.

**Output parameters**

- **SetpointPosition**
  
  double * Setpoint position array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.111 GroupPositionTargetGet

Name
GroupPositionTargetGet – Gets the target position for one or all positioners of the selected group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
Returns the target position for one or all positioners of the selected group. The target position represents the “end” position after the move.

For instance, during a move from 0 to 10 units, the position values are:

\[
\begin{align*}
&\text{GroupPositionTargetGet} => 10.0000 \\
&\text{GroupPositionCurrentGet} => 5.0005 \\
&\text{GroupPositionSetpointGet} => 5.0055 \\
\end{align*}
\]

NOTE [HXP-D only]
Use the “HexapodPositionTargetGet” function to get X, Y, Z, U, V, W coordinates system position of Tool in Work for an Hexapod group.

Prototype

\[
\text{int GroupPositionTargetGet(} \\
\quad \text{int SocketID,} \\
\quad \text{char * GroupName,} \\
\quad \text{int NbPositioners,} \\
\quad \text{double * TargetPosition} \\
\quad \text{)}
\]

Input parameters

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.
- **NbPositioners**
  - int
  - Number of positioners in the selected group.

Output parameters

- **TargetPosition**
  - double *
  - Target position array.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:
  - No error.
- -8:
  - Wrong object type for this command.
- -18:
  - Positioner Name doesn't exist or unknown command.
- -19:
  - GroupName doesn't exist or unknown command.
7.2.1.112 **GroupReferencingActionExecute**

**Name**

*GroupReferencingActionExecute* – Initiates the given action, with the given sensor and parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Validates action name and sensor name: (-8)
- Input parameter coherence: (-17)
  - For a “LatchOnHighToLowTransition” or “LatchOnLowToHighTransition” or “LatchOnIndex” or “LatchOnIndexAfterSensorHighToLowTransition” or “MoveToPreviouslyLatchedPosition” action.
  - Parameter ≤ MaximumVelocity.
  - Parameter ≠ 0.
  - Referencing state: (-22)
  - Latch must be done since referencing start for a “MoveToPreviouslyLatchedPosition” action.
- Invalid positioner name: (-18)
- Group status must be “NOT REFERENCED”: (-22)

**Description**

Initiates a referencing action for a positioner. A referencing action is defined by a given action name (see “Action list” below), with a given sensor name (see “Sensor list” below) and parameters. For more detail, see XPS User's manual referencing section.

**Action list**

<table>
<thead>
<tr>
<th>Action list</th>
<th>Sensor to be defined</th>
</tr>
</thead>
<tbody>
<tr>
<td>LatchOnHighToLowTransition</td>
<td>Yes</td>
</tr>
<tr>
<td>LatchOnIndex</td>
<td>None</td>
</tr>
<tr>
<td>LatchOnIndexAfterSensorHighToLowTransition</td>
<td>Yes</td>
</tr>
<tr>
<td>LatchOnLowToHighTransition</td>
<td>Yes</td>
</tr>
<tr>
<td>MoveRelative</td>
<td>None</td>
</tr>
<tr>
<td>MoveToPreviouslyLatchedPosition</td>
<td>None</td>
</tr>
<tr>
<td>SetPosition</td>
<td>None</td>
</tr>
<tr>
<td>SetPositionToHomePreset</td>
<td>None</td>
</tr>
</tbody>
</table>

**Sensor list**

- MechanicalZero
- MinusEndOfRun
- PlusEndOfRun
- None.

If a following error occurs during the referencing and motion is in progress, an emergency brake is applied and error (-25) is returned. The group state becomes “NOTINIT”.

If the home search time out is reached, error (-28) is returned. The group state becomes “NOTINIT”.

After referencing is done, to exit the “REFERENCING” state and to go to “READY” state use “GroupReferencingStop” function.
CAUTION
This function must be used with a positioner.

Prototype

```c
int GroupReferencingActionExecute(
    int SocketID,
    char * PositionerName,
    char * Action,
    char * Sensor,
    double Parameter
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**: char *
  - Positioner name.
- **Action**: char *
  - Referencing action name.
- **Sensor**: char *
  - Referencing sensor name.
- **Parameter**: double
  - Referencing parameter (related to the referencing action).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -28: Home search timeout.
7.2.1.113 GroupReferencingStart

Name
GroupReferencingStart – Starts the referencing mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group name: (-19)
- Group status must be “NOT REFERENCED”: (-22)

Description
Starts the referencing mode and sets the group status to “REFERENCING”.
To use this function, the selected group must be in “NOT REFERENCED” state, or error (22) is returned.
To stop the referencing mode and go to “READY” state, use “GroupReferencingStop” function.

Prototype
int GroupReferencingStart(  
    int SocketID,  
    char * GroupName  
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.114 **GroupReferencingStop**

**Name**

*GroupReferencingStop* – Stops the referencing mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group name: (-19)
- Group status must be “REFERENCING”: (-22)

**Description**

Stops the referencing mode and sets the group state to “READY”.

To use this function, the selected group must be in “REFERENCING” state, otherwise error (-22) is returned.

The travel limits are checked before stopping referencing mode. Error (-35) is returned, if the profiler position is out of range of the software travel limits and the group stays in the “REFERENCING” state.

**Prototype**

```c
int GroupReferencingStop(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  - No error.
- **-19:**
  - GroupName doesn't exist or unknown command.
- **-22:**
  - Not allowed action.
- **-35:**
  - Position is outside of travel limits.
7.2.1.115 **GroupSpinCurrentGet**

**Name**

*GroupSpinCurrentGet* – Gets the spin mode parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a Spindle group): (-8)
- Checks the positioner name: (-18)

**Description**

This function returns the current (or actual) velocity and acceleration used by the SPIN mode.

**Prototype**

```c
int GroupSpinCurrentGet(
    int SocketID,
    char * GroupName,
    double * Velocity,
    double * Acceleration
)
```

**Input parameters**

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char * Spindle group name.

**Output parameters**

Velocity double * Velocity (units/s).

Acceleration double * Acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.116 GroupSpinModeStop

**Name**

*GroupSpinModeStop* – Stops the motion of the spindle group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a Spindle group): (-8)
- Checks the positioner name (must be a group name): (-18)

**Description**

This function stops the motion of a spindle group and sets the group state to READY. To use this function, the group must be in SPINNING state, otherwise error (-22) is returned.

**Prototype**

```c
int GroupSpinModeStop(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Spindle group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
- **-22:** Not allowed action.
7.2.1.117 **GroupSpinParametersGet**

**Name**

*GroupSpinParametersGet* – Gets the spin profiler parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a spindle group): (-8)
- Checks the function (must be a spindle function): (-18)

**Description**

This function returns the “Setpoint” (theoretical) velocity and acceleration used in SPIN mode.

**Prototype**

```c
int GroupSpinParametersGet(
    int SocketID,
    char * GroupName,
    double * Velocity,
    double * Acceleration
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Spindle group name.

**Output parameters**

- **Velocity**
  - double *
  - Setpoint Velocity (units/s).
- **Acceleration**
  - double *
  - Setpoint Acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
7.2.1.118 GroupSpinParametersSet

Name
GroupSpinParametersSet – Sets the spin profiler parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a spindle group): (-8)
- Checks input parameter value: (-17)
  • Velocity ≤ MaximumVelocity.
  • Velocity ≥ MaximumVelocity.
  • Acceleration > 0.
  • Acceleration ≤ Maximum Acceleration.
- Checks the function (must be a spindle function): (-18)

Description
This function starts the SPIN mode and allows on-the-fly changes to the velocity and acceleration used by this mode. If an error occurs, the positioner stops and the velocity value is set to zero.

After the tests on input values:
  If Velocity > MaximumVelocity = > Velocity = MaximumVelocity
  If Velocity < - MaximumVelocity = > Velocity = - MaximumVelocity
  If Acceleration ≤ 0 = > ERROR and stop motion
  If Acceleration > Maximum Acceleration = > Acceleration = Maximum Acc.

Prototype
int GroupSpinParametersSet(int SocketID, char * GroupName, double Velocity, double Acceleration)

Input parameters
SocketID int Socket identifier gets by the "TCP_ConnectToServer" function.
GroupName char* Spindle group name.
Velocity double Setpoint Velocity (units/s).
Acceleration double Setpoint Acceleration (units/s²).

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)  

- 0: No error.  
- -8: Wrong object type for this command.  
- -17: Parameter out of range or incorrect.  
- -18: Positioner Name doesn't exist or unknown command.  
- -19: GroupName doesn't exist or unknown command.
7.2.1.119 **GroupStatusGet**

**Name**

*GroupStatusGet* – Gets the group status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group name: (-19)

**Description**

Returns the group status code. The group status codes are listed in section 8.8: “Group Status List”.

The description of group status code can be retrieved from “GroupStatusStringGet” function.

**Prototype**

```c
int GroupStatusGet(  
    int SocketID,  
    char * GroupName,  
    int * GroupStatus  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**

- **GroupStatus** int * Status of the group.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.120 GroupStatusStringGet

Name

**GroupStatusStringGet** – Gets the group status description from a group status code.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description

This function returns the group status description corresponding to a group status code (see section 8.10: “Controller Status List”).

If the group status code is not referenced, “Error: ( “undefined status”) will be returned.

Prototype

```c
int GroupStatusStringGet(
    int SocketID,
    int GroupStatusCode,
    char * GroupStatusString
)
```

Input parameters

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupStatusCode**  
  int  
  Group status code.

Output parameters

- **GroupStatusString**  
  char *  
  Group status description.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**:  
  No error.
7.2.1.121 **GroupVelocityCurrentGet**

**Name**

*GroupVelocityCurrentGet* – Gets the current velocity for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

Returns the current velocity for one or all positioners of the selected group.

**Prototype**

```c
int GroupVelocityCurrentGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    double * CurrentVelocity
)
```

**Input parameters**

- **SocketID**
  - int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *: Group name.
- **NbPositioners**
  - int: Number of positioners in the selected group.

**Output parameters**

- **CurrentVelocity**
  - double *: Current Velocity array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
7.2.1.122 GroupVelocitySetpointGet

**Name**

*GroupVelocitySetpointGet* – Gets the setpoint velocity for one or all positioners of the selected group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type: (-8)
- Checks positioner name: (-18)
- Checks group name: (-19)

**Description**

Gets the setpoint velocity for one or all positioners of the selected group.

**Prototype**

```c
int GroupVelocitySetpointGet(
    int SocketID,
    char * GroupName[250],
    int NbPositioners,
    double * SetpointVelocity
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *
  - Group or positioner name.
- **NbPositioners**: int
  - Number of positioners in the group.

**Output parameters**

- **SetpointVelocity**: double *
  - Setpoint velocity array.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner name doesn't exist or unknown command.
- **-19**: Group name doesn't exist or unknown command.
7.2.1.123 HardwareDateAndTimeGet

**Name**

HardwareDateAndTimeGet – Gets the current date and time.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the current date and time of XPS controller with the format “WeekDay Month Day Hour:Minute:Second Year”, for example “Tue Jan 15 10:28:06 2008”.

---

**NOTE**

The date and time returned by the controller are not guaranteed and should not be used as a reference.

---

**Prototype**

```c
int HardwareDateAndTimeGet(
    int SocketID,
    char * DateAndTime
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **DateAndTime** char * Controller date and time.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.124 HardwareDateAndTimeSet

Name
HardwareDateAndTimeSet – Sets the date and time.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function sets the date and time of the XPS controller. The date format must be “WeekDay Month Day Hour:Minute:Second Year “, for example “Tue Jan 15 10:28:06 2008”.

Prototype
int HardwareDateAndTimeSet(
    int SocketID,
    char * DateAndTime
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
DateAndTime char * Controller date and time.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0:
    No error.
7.2.1.125 **HardwareDriverAndStageGet**

**Name**

*HardwareDriverAndStageGet* – Gets smart hardware.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks plug number: (-17)
- Checks if the group is not in NOTINIT state: (-22)

**Description**

This function reads the driver reference and the smart stage name (only for a smart stage) from board EEPROMs for the selected positioner plug number.

**Prototype**

```c
int HardwareDriverAndStageGet(
    int SocketID,
    int PlugNumber,
    char * DriverName,
    char * StageName,
)
```

**Input parameters**

- **SocketID**
  - int Socket identifier gets by the `TCP_ConnectToServer` function.
- **PlugNumber**
  - int Positioner plug number.

**Output parameters**

- **DriverName**
  - char * Driver reference.
- **StageName**
  - char * Smart stage name.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
7.2.1.126 HexapodCoordinatesGet [HXP-D]

Name
HexapodCoordinatesGet – Takes a point X, Y, Z, U, V, W as input in a specified coordinate system (Work, Tool, Base) and give its position in another coordinate system (Work, Tool, Base)

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type because not an hexapod group: (-8)
- Invalid group name: (-19)
- Input/Output coordinate systems must be Work, Tool or Base: (-17)
- Check coordinate systems to convert: (-1116)

Description
This function transform an input hexapod position specified in one coordinate system (Work, Tool or Base) into its hexapod position in one other coordinate system (Work, Tool or Base). The input coordinate system must be different to the output coordinate system.

Prototype
int HexapodCoordinatesGet (int SocketID, char *GroupName, char * CoordinateSystemIn, char * CoordinateSystemOut, double Xin, double Yin, double Zin, double Uin, double Vin, double Win, double *Xout, double *Yout, double *Zout, double *Uout, double *Vout, double *Wout)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Hexapod group name
CoordinateSystemIn char * Input coordinate system: Work, Tool or Base
CoordinateSystemOut char * Output coordinate system: Work, Tool or Base
Xin, Yin, Zin double Input Hexapod positions (units)
Uin, Vin, Win double Input Hexapod positions (degrees)

Output parameters
Xout, Yout, Zout double * Output Hexapod positions (units)
Uout, Vout, Wout double * Output Hexapod positions (degrees)
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system
7.2.1.127 **HexapodCoordinateSystemGet [HXP-D]**

**Name**

*HexapodCoordinateSystemGet* – Get the position of a coordinate system

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type because not an hexapod group: (-8)
- Invalid group name: (-19)
- Coordinate systems must be Work, Tool or Base: (-17)
- Check coordinate systems to convert: (-1116)

**Description**

This function allows you to get the position of a coordinate system in its predecessor.

- **Work** is defined in **WORLD**
- **Base** is defined in **WORLD**
- **Tool** is defined in **CARRIAGE**

**Prototype**

```c
int HexapodCoordinateSystemGet (  
    int SocketID,  
    char *GroupName ,  
    char *CoordinateSystem,  
    double *X, double *Y, double *Z,  
    double *U, double *V, double *W)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Hexapod group name
- **CoordinateSystem**
  - char *
  - Coordinate system: Work, Tool or Base

**Output parameters**

- **X, Y, Z**
  - double *
  - Coordinate system positions (units)
- **U, V, W**
  - double *
  - Coordinate system positions (degrees)
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system
7.2.1.128 HexapodCoordinateSystemSet [HXP-D]

Name

**HexapodCoordinatesSystemSet** – Modify on-the-fly the position of a coordinate system

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type because not an hexapod group: (-8)
- Invalid group name: (-19)
- Coordinate systems must be Work, Tool or Base: (-17)
- Check coordinate systems to convert: (-1116)

Description

This function allows you to set the position of a coordinate system in its predecessor.

- Work is defined in WORLD
- Base is defined in WORLD
- Tool is defined in CARRIAGE

This function does not change the settings in the system.ini file. It only changes the current positions of Tool and Work. After booting the HXP controller, always the default values from the system.ini are used.

In the default configuration of the HXP, the center of the Tool coordinate system is at the center of the upper surface of the Hexapod carriage, Z is orthogonal to the carriage, and X is in the direction of the motor cables, when the Hexapod is at its reference Home position.

This means the default pivot point for all absolute moves (HexapodMoveAbsolute()) and for all incremental rotations around Tool (HexapodMoveIncremental (GroupName, Tool)) is the center of the top surface of the carriage. To change this pivot point, one must change the position of the Tool coordinate system.

Prototype

```c
int HexapodCoordinateSystemSet (  
    int SocketID,  
    char *GroupName,  
    char * CoordinateSystem,  
    double X, double Y, double Z,  
    double U, double V, double W)  
```
Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char * Hexapod group name

CoordinateSystem char * Coordinate system: Work, Tool or Base

X, Y, Z double Coordinate system positions (units)

U, V, W double Coordinate system positions (degrees)

Output parameters

None

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system
7.2.1.129 HexapodMoveAbsolute [HXP-D]

**Name**

HexapodMoveAbsolute – Do an absolute move of the Tool coordinate system in the Work coordinate system.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Verifies leg target position in relation with the positioner travel limits: (-17)
  - LegTargetPosition ≥ MinimumTargetPosition.
  - LegTargetPosition ≤ MaximumTargetPosition.
- Invalid group name: (-19)
- Invalid coordinate system must be Work: (-17)
- Group status must be "READY": (-22)

**Description**

This function moves the Hexapod to the target position (X Y Z U V W).

To be more precise, it moves the Tool coordinate system, and hence the carriage of the Hexapod that moves with the Tool coordinate system, to the position (X Y Z U V W) in the Work coordinate system.

The group state must be “READY” else the (-22) error is returned. If the group is “READY” then the group status becomes “MOVING”.

Each “positioner” move refers to the acceleration, velocity, MinimumJerkTime and MaximumJerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.

If a “MotionDoneMode” is defined as “VelocityAndPositionWindowMotionDone” then an (-33) error can be returned if the time out (defined by “MotionDoneTimeout” in the stages.ini file) is reached before the motion done.

If “AbortMove” or “GroupMoveAbort” is done, an (-27) error is returned. In this case, the motion in progress is stopped and the group status becomes “READY”.

If a “GroupKill” command, an emergency brake or an emergency stop is occurred, an (-26) error is returned. In this case, the motion in progress is stopped and the group status becomes “NOT INITIALIZED”.

**NOTE**

As the motion is synchronized on the Hexapod struts, the motion does not follow an ideal “straight” trajectory in the work coordinate system. For a 1 mm long trajectory, for example, this may result in a deviation of ~2 μm from the ideal trajectory in the work coordinate system.
Prototype

```c
int HexapodMoveAbsolute (  
    int SocketID,  
    char *GroupName,  
    char * CoordinateSystem,  
    double X, double Y, double Z, double U, double V, double W)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Hexapod group name
- **CoordinateSystem**: char * Has to be Work
- **X, Y, Z**: double Hexapod target positions in Work (units)
- **U, V, W**: double Hexapod target positions in Work (degrees)

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-19**: GroupName doesn’t exist or unknown command.
- **-22**: Not allowed action.
- **-25**: Following Error.
- **-26**: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- **-27**: Move Aborted.
- **-33**: Motion done timeout.
- **-44**: Slave error disabling master.
- **-120**: Warning following error during move with position compare enabled.
### 7.2.1.130 HexapodMoveIncremental [HXP-D]

**Name**

HexapodMoveIncremental – Performs an incremental move along and around the axis of the Work or Tool coordinate system.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group type and group name (group or positioner): (-8) (-19)
- Verifies leg target position in relation with the positioner travel limits: (-17)
  - LegTargetPosition ≥ MinimumTargetPosition.
  - LegTargetPosition ≤ MaximumTargetPosition.
- Invalid coordinate system must be Work or Tool: (-17)
- Group status must be "READY": (-22)

**Description**

This function performs an incremental move along and around the axis of the Work or Tool coordinate system.

The group state must be “READY” else the (-22) error is returned. If the group is “READY” then the group status becomes “MOVING”.

Each “positioner” move refers to the acceleration, velocity, MinimumJerkTime and MaximumJerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.

If a “MotionDoneMode” is defined as “VelocityAndPositionWindowMotionDone” then an (-33) error can be returned if the time out (defined by “MotionDoneTimeout” in the stages.ini file) is reached before the motion done.

If “AbortMove” or “GroupMoveAbort” is done, an (-27) error is returned. In this case, the motion in progress is stopped and the group status becomes “READY”.

If a “GroupKill” command, an emergency brake or an emergency stop is occurred, an (-26) error is returned. In this case, the motion in progress is stopped and the group status becomes “NOT INITIALIZED”.

Although this function is very well defined and can be used to increment all 6 coordinates at the same time, it is recommended to increment either only linear coordinates (XYZ), or only one angular coordinate (U, V, or W) at a time.

**Prototype**

```c
int HexapodMoveIncremental (  
    int SocketID,  
    char *GroupName,  
    char * CoordinateSystem,  
    double X, double Y, double Z, double U, double V, double W)
```
### Input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Hexapod group name</td>
</tr>
<tr>
<td>CoordinateSystem</td>

<td>Has to be Work or Tool</td>
</tr>
<tr>
<td>X, Y, Z</td>
<td>double</td>
<td>Linear increments (units)</td>
</tr>
<tr>
<td>U, V, W</td>
<td>double</td>
<td>Angular increment (degrees)</td>
</tr>
</tbody>
</table>

### Output parameters

None.

### Return

(In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
- **-22:** Not allowed action.
- **-25:** Following Error.
- **-26:** Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- **-27:** Move Aborted.
- **-33:** Motion done timeout.
- **-44:** Slave error disabling master.
- **-120:** Warning following error during move with position compare enabled.
7.2.1.131 HexapodMoveIncrementalControl [HXP-D]

**Name**

HexapodMoveIncrementalControl – Hexapod trajectory (Line, Arc or Rotation) execution.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group type and group name (group or positioner): (-8) (-19)
- Check the coordinate system (must be Work or Tool) (-1116)
- Check the trajectory type (must be “Line”, “Arc” or “Rotation”): (-1117)

**Description**

This function allows executing a hexapod trajectory (Line, Arc or Rotation) with the maximum velocity.

- **Line**: the displacement value is not limited (only by a double format)
- **Rotation**: the displacement value is between –90° and +90° (the limitation is due to Bryant representation)
- **Arc**: the displacement value is between –90° and +90° (the limitation is due to Bryant representation) if the arc is defined with 3 axis. And if the rotation is defined with only one axis, a value greater 90° could be used.

The units in case of “Arc” and “Rotation” (U,V,W) are Degrees.

**Prototype**

```c
int HexapodMoveIncrementalControl ( int SocketID,
                                        char GroupName [250],
                                        char CoordinateSystem [250],
                                        char HexapodTrajectoryType[250],
                                        double dX,
                                        double dY,
                                        double dZ)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function
- **GroupName** char * Group name
- **CoordinateSystem** char * Coordinate System (Work or Tool)
- **HexapodTrajectoryType** char * Hexapod Trajectory Type (Line, Arc or Rotation)
- **dX** (or dU) double incremental displacement value (units)
- **dY** (or dY) double incremental displacement value (units)
- **dZ** (or dW) double incremental displacement value (units)

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system
- -1117: Wrong trajectory type
7.2.1.132 HexapodMoveIncrementalControlLimitGet [HXP-D]

Name
HexapodMoveIncrementalControlLimitGet – Returns the maximum velocity of carriage and the percent of the trajectory executable

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid group type and group name (group or positioner): (-8) (-19)
- Check the coordinate system (must be Work or Tool): (-1116)
- Check the trajectory type (must be “Line”, “Arc” or “Rotation”): (-1117)

Description
This function allows getting the maximum velocity of Tool and the percent of the trajectory executable.
The units in case of “Arc” and “Rotation” (U,V,W) are Degrees.

Prototype
int HexapodMoveIncrementalControlLimitGet (  
    int SocketID,  
    char GroupName[250],  
    char CoordinateSystem[250],  
    char HexapodTrajectoryType[250],  
    double dX,  
    double dY,  
    double dZ,  
    double *MaximumVelocity,  
    double *TrajectoryPercent)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function
GroupName char * Group name
CoordinateSystem char * Coordinate System (Work or Tool)
HexapodTrajectoryType char * Hexapod Trajectory Type (Line, Arc or Rotation)
dX (or dU) double incremental displacement value (units)
dY (or dV) double incremental displacement value (units)
dZ (or dW) double incremental displacement value (units)

Output parameters
MaximumVelocity double * Maximum velocity of Tool (units/sec)
TrajectoryPercent double * Percent of the trajectory executable

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system
- -1117: Wrong trajectory type
### 7.2.1.133 HexapodMoveIncrementalControlPulseAndGatheringSet [HXP-D]

**Name**

HexapodMoveIncrementalControlPulseAndGatheringSet – Configure gathering with pulses

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check the divisor value (must be positive): (-17)

**Description**

This function allows configuring gathering with pulses: gathered data are X, Y, Z, U, V, W and pulses will be generated during only constant velocity.

Once gathering with pulses is configured, the customer could send HexapodMoveIncrementalControl API to activate it.

The pulses are generated during only SGamma Constant Velocity (Window) and at the same time the data’ll be gathered at each pulse.

The interval between 2 pulses: Divisor \* CorrectorISRPeriod (sec)

So at the end of the displacement, the customer could send the GatheringStopAndSave API, and see the gathered data and know exactly at which position a pulse has been generated.

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>Extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

**Prototype**

```c
int HexapodMoveIncrementalControlPulseAndGatheringSet (  
  int SocketID,  
  char GroupName[250],  
  int Divisor)
```

**Input parameters**

- **SocketID** int – Socket identifier gets by the “TCP_ConnectToServer” function
- **GroupName** char * – Group name
- **Divisor** int – Divisor \* CorrectorISRPeriod = interval in sec between 2 pulses

**Output parameters**

None

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command
7.2.1.134 **HexapodMoveIncrementalControlWithTargetVelocity** [HXP-D]

### Name
**HexapodMoveIncrementalControlWithTargetVelocity** – Hexapod trajectory (Line, Arc or Rotation) execution.

### Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check the coordinate system (must be **Work** or **Tool**): (-1116)
- Check the trajectory type (must be “Line”, “Arc” or “Rotation”): (-1117)

### Description
This function allows executing a hexapod trajectory (Line, Arc or Rotation) with the specified velocity.

**Line**: the displacement value is not limited (only by a double format)

**Rotation**: the displacement value is between $-90^\circ$ and $+90^\circ$ (the limitation is due to Bryant representation)

**Arc**: the displacement value is between $-90^\circ$ and $+90^\circ$ (the limitation is due to Bryant representation) if the arc is defined with 3 axis. And if the rotation is defined with only one axis, a value greater $90^\circ$ could be used.

The **units** in case of “Arc” and “Rotation” (U,V,W) are Degrees.

### Prototype
```c
int HexapodMoveIncrementalControlWithTargetVelocity ( 
    int SocketID, 
    char GroupName[250], 
    char CoordinateSystem[250], 
    char HexapodTrajectoryType[250], 
    double dX, 
    double dY, 
    double dZ, 
    double Velocity)
```

### Input parameters
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function
- **GroupName** char * Group name
- **CoordinateSystem** char * Coordinate System (**Work** or **Tool**)
- **HexapodTrajectoryType** char * Hexapod Trajectory Type (Line, Arc or Rotation)
- **dX** (or **dU**) double incremental displacement value (units)
- **dY** (or **dV**) double incremental displacement value (units)
- **dZ** (or **dW**) double incremental displacement value (units)
- **Velocity** double motion velocity (units / seconds)

### Output parameters
None
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -1116: Wrong coordinate system.
- -1117: Wrong trajectory type.
7.2.1.135 HexapodPositionCurrentGet [HXP-D]

Name

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check group type and group name: (-8) (-19)
- Check hexapod positioner: (-18)

Description

This function returns the current X, Y, Z, U, V, W coordinates of the Hexapod platform (the position of the Tool coordinate system in the Work coordinate system).

In case of PositionerName, it must be defined like following:

- Hexapod.X
- Hexapod.Y
- Hexapod.Z
- Hexapod.U
- Hexapod.V
- Hexapod.W

Prototype

int HexapodPositionCurrentGet (  
    int SocketID,  
    char *GroupName,  
    int NbPositioners,  
    double * HexapodCurrentPosition)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name / Positioner name
NbPositioners int Number of positioners in the selected group.

Output parameters

HexapodCurrentPosition double * Hexapod current position array

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command
- -19: GroupName doesn't exist or unknown command.
7.2.1.136 HexapodPositionSetpointGet [HXP-D]

Name

HexapodPositionSetpointGet – When queried for a group, returns setpoint position of the Tool coordinate system in the Work coordinate system with X, Y, Z, U, V, W values.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check group type and group name: (-8) (-19)
- Check hexapod positioner: (-18)

Description

This function returns the setpoint X, Y, Z, U, V, W coordinates of the Hexapod platform (the position of the Tool coordinate system in the Work coordinate system).

In case of PositionerName, it must be defined like following:

- Hexapod.X
- Hexapod.Y
- Hexapod.Z
- Hexapod.U
- Hexapod.V
- Hexapod.W

Prototype

int HexapodPositionSetpointGet (  
    int SocketID,  
    char *GroupName,  
    int NbPositioners,  
    double * HexapodSetpointPosition)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name / Hexapod positioner name
NbPositioners int Number of positioners in the selected group.

Output parameters

HexapodSetpointPosition double * Hexapod setpoint position array

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18 : Positioner Name doesn't exist or unknown command
- -19: GroupName doesn't exist or unknown command.
7.2.1.137 HexapodPositionTargetGet [HXP-D]

Name
HexapodPositionTargetGet – When queried for a group, returns target position of the Tool coordinate system in the Work coordinate system with X, Y, Z, U, V, W values.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check group type and group name: (-8) (-19)
- Check hexapod positioner: (-18)

Description
This function returns the target X, Y, Z, U, V, W coordinates of the Hexapod platform (the position of the Tool coordinate system in the Work coordinate system).

In case of PositionerName, it must be defined like following:

- Hexapod.X
- Hexapod.Y
- Hexapod.Z
- Hexapod.U
- Hexapod.V
- Hexapod.W

Prototype
int HexapodPositionTargetGet (  
    int SocketID,  
    char *GroupName,  
    int NbPositioners,  
    double * HexapodTargetPosition)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name / Hexapod positioner name
NbPositioners int Number of positioners in the selected group.

Output parameters
HexapodTargetPosition double * Hexapod target position array

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command
- -19: GroupName doesn't exist or unknown command.
7.2.1.138 **HexapodSGammaParametersDistanceGet [HXP-D]**

**Name**

**HexapodSGammaParametersDistanceGet** – Returns distance during acceleration phase and distance during constant velocity phase in the virtual SGamma profiler used to define a hexapod trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Check group type and group name: (-8) (-19)
- Check hexapod positioner: (-18)

**Description**

This function allows getting the distance during acceleration phase and the distance during constant velocity phase of the SGamma motion profile used to define a hexapod trajectory.

**Prototype**

```c
int HexapodSGammaParametersDistanceGet ( 
    int SocketID, 
    char FullPositionerName[250],
    double Displacement,
    double Velocity,
    double Acceleration,
    double MinJerkTime,
    double MaxJerkTime,
    double *DisplacementDuringAcc, 
    double *DisplacementDuringVel)
```

**Input parameters**

- **SocketID** – int 
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** – char * 
  Positioner name
- **Displacement** – double 
  Displacement value (units)
- **Velocity** – double 
  Motion velocity (units / seconds)
- **Acceleration** – double 
  Motion acceleration (units / seconds²)
- **MinimumJerkTime** – double 
  Minimum jerk time (seconds)
- **MaximumJerkTime** – double 
  Maximum jerk time (seconds)

**Output parameters**

- **DisplacementDuringAcc** – double * 
  Displacement value during acceleration phase (units)
- **DisplacementDuringVel** – double * 
  Displacement value during constant velocity phase (units)

**Return**

(In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command
- **-19:** GroupName doesn't exist or unknown command.
7.2.1.139 **InstallerVersionGet**

**Name**

*InstallerVersionGet*— Gets the installer pack version installed in the controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the installer pack version used for the current firmware installation.

**Prototype**

```c
int InstallerVersionGet(
    int SocketID,
    char * Version
)
```

**Input parameters**

- **SocketID**
  - int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **Version**
  - char *: Installer pack version.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  - No error.
7.2.1.140 INTServitudesCommandGet [ISA]

Name
INTServitudesCommandGet – Reads INT servitudes command.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function returns the INT servitudes command register value.

Prototype
int INTServitudesCommandGet(
    int SocketID,
    short * INTServitudesCommand
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
INTServitudesCommand short * INT servitudes command.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -126: Wrong parameter type in the command string: short or short * expected.
7.2.1.141 INTServitudesStatusGet [ISA]

Name
INTServitudesStatusGet – Reads INT servitudes status.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function returns the INT servitudes status register value.

Prototype
```c
int INTServitudesStatusGet(
    int SocketID,
    short * INTServitudesStatus
)
```

Input parameters
SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.

Output parameters
INTServitudesStatus short * INT servitudes status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -126: Wrong parameter type in the command string: short or short * expected.
7.2.1.142 KillAll

**Name**
KillAll – Kills all groups.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function kills and resets all groups as well as all analog and digital I/O’s

The following sequence of steps is performed by KillAll function.

1) An “emergency stop” is executed if the group state is defined as:
   - HOMING
   - REFERENCING
   - MOVING
   - JOGGING
   - ANALOG_TRACKING

2) The motor is turned off, the motion done is stopped and the control loop is stopped.

3) “ERR_EMERGENCY_SIGNAL” is returned by each function in progress, and for groups that are in following states:
   - MOTOR_INIT
   - ENCODER_CALIBRATING
   - HOMING
   - REFERENCING
   - MOVING
   - TRAJECTORY
   - ERR_EMERGENCY_SIGNAL

4) the group state is not initialized “NOTINIT” for all groups.

**Prototype**

```c
int KillAll(  
    int SocketID  
)
```

**Input parameters**

- `SocketID`: int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.143 Login

**Name**
Login – Self-identification.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the user name and the password: (-106)

**Description**
This function allows a user to identify himself as “SuperUser”, “Administrator” or “User”.
The user account must be exited, otherwise error (-106) is returned.
This function is not meant to be used from the “terminal” web page.

---
**NOTE**
To add a new user account, you must use the XPS web site with “Administrator” rights.
In the main menu, select “Controller” and go to the “Users management” page.

**Prototype**
int Login(
    char * Name,
    char * Password
)

**Input parameters**
Name char * User name.
Password char * User password.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -106: Wrong user name or password.
- -123: Action not allowed, an Administrator is already logged in.
7.2.1.144 LoginS

Name
LoginS – Self-identification in secured mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the user name and the crypted password: (-106)

Description
This function allows a user to identify himself as “SuperUser”, “Administrator” or “User”.
The user account must be exited, otherwise error (-106) is returned.
This function is not meant to be used from the “terminal” web page.

NOTE
To add a new user account, you must use the XPS web site with “Administrator” rights. In the main menu, select “Controller ” and go to the “Users management” page.

Prototype
int Login(
    char * Name,
    char * CryptedPassword
)

Input parameters
Name char * User name.
CryptedPassword char * Crypted User password.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -106: Wrong user name or crypted password.
- -123: Action not allowed, an Administrator is already logged in.
7.2.1.145 MultipleAxesPDSAAxisByAxisExecution

**Name**

`MultipleAxesPDSAAxisByAxisExecution` – Executes an axis by axis search algorithm.

**Input tests**

- Checks group type (must be a MultipleAxes group): (-8)
- Group state must be “READY”: (-22)
- Checks message queue: (-71)

**Description**

This function executes from the current position, stages execute axis by axis a relative move in both directions, and then returns to the location of the highest power found.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

**Prototype**

```c
int MultipleAxesPDSAAxisByAxisExecution ( 
    int SocketID,
    int *IsTreshold Reached,
    double *Signal Value,
    char PositionerNameList [255],
    double Range Array,
    double *Positioner Peak Location Array,
)
```

**Input parameters**

- **SocketID**
  
  `int` Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerNameList**
  
  `char *` List of axes, up to 6 axes names in the desired order.

- **Range array**
  
  `double` Range value for each axis.

**Output parameters**

- **IsThresholdReached**

  `int *` 1 if the threshold is reached 0 if not.

- **SignalValue**

  `double *` Value of the highest power found.

- **PositionerPeakLocationArray**

  `double*` Value of the PeakLocation of each axis.
Return

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
### 7.2.1.146 MultipleAxesPDSASpiralStepExecution

**Name**

MultipleAxesPDSASpiralStepExecutionAPI – Executes a spiral step search algorithm.

**Input tests**

- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (Range must > Step): (-1057)
- Group state must be “READY”: (-22)
- Checks message queue: (-71)

**Description**

This function used to find first-light or peak power, stages are moved in an outward “spiral” until reaching the power threshold or to the highest power position after completing the scan without reaching the power threshold “Step by step” motion allows stopping as soon as the power threshold is reached.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

---

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

**Prototype**

```c
int MultipleAxesPDSASpiralStepExecutionAPI (  
    int SocketID,  
    char PositionerName[255],  
    char PositionerName[255],  
    double Step,  
    double Range,  
    int *IsTresholdReached,  
    double *SignalValue,  
    double *FirstPositionerPeakLocation,  
    double *SecondPositionerPeakLocation,  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * First Axis.
- **PositionerName** char * Second Axis.
- **Step** double Spiral step size.
- **Range** double Spiral total range.
Output parameters

IsThresholdReached  int *  1 if the threshold is reached 0 if not.
SignalValue        double *  Value of the highest power found.
FirstPositionerPeakLocation  double*  Value of the PeakLocation of the first axis.
SecondPositionerPeakLocation   double*  Value of the PeakLocation of the second axis.

Return

- 0:  No error.
- -3:  String too long.
- -8:  Wrong object type for this command.
- -17:  Parameter out of range or incorrect.
- -19:  Group name doesn't exist or unknown command.
- -22:  Not allowed action.
- -25:  Following Error.
- -33:  Motion done timeout.
- -1056: Signal below threshold.
- -1057: Range must be higher than step.
7.2.1.147 MultipleAxesPDSASpiralContinuousExecution

Name
MultipleAxesPDSASpiralContinuousExecution – Executes a spiral continuous search algorithm.

Input tests
- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (Range must > Step): (-1057)
- Checks input value (Speed must > 0): (-17)
- Group state must be "READY": (-22)
- Checks message queue: (-71)

Description
This function used to find first-light or peak power, stages are moved in an outward “spiral” until reaching the power threshold or to the highest power position after completing the scan without reaching the power threshold “Continuous” motion completes the whole spiral in a smoother way and returns to the highest power position.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

NOTE
In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int MultipleAxesPDSASpiralContinuousExecution(
    int SocketID,
    char PositionerName[255],
    char PositionerName[255],
    double Step,
    double Range,
    double Speed,
    int *IsThresholdReached,
    double *SignalValue,
    double *FirstPositionerPeakLocation,
    double *SecondPositionerPeakLocation,
)
### Input parameters

- **SocketID**
  - Type: int
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerName**
  - Type: char *
  - Description: First Axis.

- **PositionerName**
  - Type: char *
  - Description: Second Axis.

- **Step**
  - Type: double
  - Description: Spiral step size.

- **Range**
  - Type: double
  - Description: Spiral total range.

- **Speed**
  - Type: double
  - Description: Speed on spiral

### Output parameters

- **IsThresholdReached**
  - Type: int *
  - Description: 1 if the threshold is reached 0 if not.

- **SignalValue**
  - Type: double *
  - Description: Value of the highest power found.

- **FirstPositionerPeakLocation**
  - Type: double *
  - Description: Value of the PeakLocation of the first axis.

- **SecondPositionerPeakLocation**
  - Type: double *
  - Description: Value of the PeakLocation of the second axis.

### Return

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -1056: Signal below threshold.
- -1057: Range must be higher than step.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.148 **MultipleAxesPDSARasterExecution**

**Name**

*MultipleAxesPDSARasterExecution* – Executes a raster search algorithm.

**Input tests**

- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (Length must > Step): (-1059)
- Group state must be "READY": (-22)
- Checks message queue: (-71)

**Description**

This function used to find first-light or peak power, stages are moved in a raster scan way until reaching the power threshold or to the highest power position after completing the scan without reaching the power threshold.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

**Prototype**

```c
int MultipleAxesPDSARasterExecution ( int SocketID,
   char PositionerName[255],
   char PositionerName[255],
   double Length,
   double Step,
   double Width,
   int *IsThresholdReached,
   double *SignalValue,
   double *FirstPositionerPeakLocation,
   double *SecondPositionerPeakLocation,
);```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the &quot;TCP_ConnectToServer&quot; function.</td>

Output parameters

- IsTresholdReached: int * 1 if the threshold is reached 0 if not.
- SignalValue: double * Value of the highest power found.
- FirstPositionerPeakLocation: double* Value of the PeakLocation of the first axis.
- SecondPositionerPeakLocation: double* Value of the PeakLocation of the second axis.

Return

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -1056: Signal below threshold.
- -1059: Length must be higher than step.
7.2.1.149 MultipleAxesPDSADichotomyExecution

Name
MultipleAxesPDSADichotomyExecution – Executes a dichotomy search algorithm.

Input tests
- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (MaxReductionFactor must > ReductionFactor): (-1058)
- Group state must be “READY”: (-22)
- Checks message queue: (-71)

Description
In this function stages are moved axis by axis on a wide range using large steps to find a “summit” and return to it. Then the principle is repeated with smaller steps, until finding the peak power position.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

NOTE
In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int MultipleAxesPDSADichotomyExecution (  
  int SocketID,  
  double ReductionFactor,  
  double MaxReductionFactor  
  int *IsThresholdReached,  
  double *SignalValue,  
  char PositionerNameList [255],  
  double StepArray,  
  double *PositionerPeakLocationArray,  
)  

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

ReductionFactor double
MaxReductionFactor double
PositionerNameList char * List of axes, up to 6 axes names in the desired order.

Steparray double Initial step value for each axis.
Output parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsTresholdReached</td>
<td>int*</td>
<td>1 if the threshold is reached 0 if not.</td>
</tr>
<tr>
<td>SignalValue</td>
<td>double*</td>
<td>Value of the highest power found.</td>
</tr>
<tr>
<td>FirstPositionerPeakLocation</td>
<td>double*</td>
<td>Value of the PeakLocation of the first axis.</td>
</tr>
<tr>
<td>SecondPositionerPeakLocation</td>
<td>double*</td>
<td>Value of the PeakLocation of the second axis.</td>
</tr>
</tbody>
</table>

Return

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -1056: Signal below threshold.
- -1058: Max reduction factor must be higher than reduction factor.
7.2.1.150 MultipleAxesPDSAEscaladeStepExecution

**Name**

MultipleAxesPDSAEscaladeStepExecution – Executes an escalade step search algorithm.

**Input tests**

- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (Range must > Step): (-1057)
- Group state must be “READY”: (-22)
- Checks message queue: (-71)

**Description**

In this function after completing a first spiral search, a half size second spiral is executed at a different Z position, then stages moves step by step (by a quarter of Z motion) on the axis defined by the two spiral peak power until reaching a maximum or the threshold.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

This algorithm works only on X, Y and Z axes

**Prototype**

```c
int MultipleAxesPDSAEscaladeStepExecution ( 
  int SocketID, 
  char GroupName[255], 
  double XYStep, 
  double XYRange, 
  double Zstep
  int *IsTresholdReached, 
  double *SignalValue, 
  double *SearchTime, 
  double *FirstPositionerPeakLocation, 
  double *SecondPositionerPeakLocation, 
  double *ZPeakLocation,
 )
```

**Input parameters**

<table>
<thead>

ZStep double First Z motion.

Output parameters
IsThresholdReached int * 1 if the threshold is reached 0 if not.
SignalValue double * Value of the highest power found.
SearchTime double * Value of the search time.
FirstPositionerPeakLocation double* Value of the PeakLocation of the first axis.
SecondPositionerPeakLocation double* Value of the PeakLocation of the second axis.
ZPeakLocation double * Value of the Peak location of Z axis.

Return
- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -1056: Signal below threshold.
- -1057: Range must be higher than step.
7.2.1.151 MultipleAxesPDSA_EscaladeContinuousExecution

Name
MultipleAxesPDSA_EscaladeContinuousExecution – Executes a spiral continuous search algorithm.

Input tests
- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (Range must > Step): (-1057)
- Checks input value (Speed must > 0): (-17)
- Group state must be "READY": (-22)
- Checks message queue: (-71)

Description
In this function after completing a first spiral search, a half size second spiral is executed at a different Z position, then stages moves step by step (by a quarter of Z motion) on the axis defined by the two spiral peak power until reaching a maximum or the threshold.

During the algorithm execution, if a positioner reaches one of its travel limits, the execution stops and error (-25) is generated under positioner errors.

NOTE
In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int MultipleAxesPDSA_EscaladeContinuousExecution ( int SocketID,
            char GroupName[255],
            double XYStep,
            double XYRange,
            double Zstep
            double Speed
            int *IsThresholdReached,
            double *SignalValue,
            double *SearchTime,
            double *FirstPositionerPeakLocation,
            double *SecondPositionerPeakLocation,
            double *ZPeakLocation,
            )

**Return**

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -1056: Signal below threshold.
- -1057: Range must be higher than step.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.152 **MultipleAxesPTExecution**

**Name**

*MultipleAxesPTExecution* – Executes a PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)

**Description**

This function executes a PT (Position Time) trajectory. The trajectory file must be stored in “\Admin\Public\Trajectory” folder of the XPS controller. If the trajectory cannot be initialized (message queue or task error), error (-72) is returned.

Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “MultipleAxesPTVerification” and “MultipleAxesPTVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and error (-25) is generated under positioner errors.

---

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

**Prototype**

```c
int MultipleAxesPTExecution(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    int ExecutionNumber
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>FileName</td>
<td>char *</td>
<td>Trajectory file name.</td>
</tr>
<tr>
<td>ExecutionNumber</td>
<td>int</td>
<td>Number of trajectory executions.</td>
</tr>
</tbody>
</table>
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.153 MultipleAxesPTLoadToMemory [Extended]

**Name**

MultipleAxesPTLoadToMemory – Loads some lines of PT trajectory to the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and ≤400): (-3) or (-17)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function loads some lines of PT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “|” and “n” two successive characters). To verify or to execute the PT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

**NOTES**

- All of the PT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PT trajectory in RAM as it does from a disk.

  *Example:*

  `MultipleAxesPTLoadToMemory(socketId,myGroup,"dT1,dX11,dX12#…dTn,dXn1,dXn2#")`

  `MultipleAxesPTVerification (socketId,myGroup,FromMemory)`

  `MultipleAxesPTExecution(socketId,myGroup,FromMemory,1)`

**Prototype**

```c
int MultipleAxesPTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char TrajectoryData[400]
)
```

**Input parameters**

- **SocketID**
  int, Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  char *, Group name.
- **TrajectoryData**
  char *, Trajectory data lines.

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.154 **MultipleAxesPTParametersGet**

**Name**

*MultipleAxesPTParametersGet* – Gets PT trajectory parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PT): (-22)

**Description**

This function returns the PT trajectory parameters (trajectory name and current executing element number) of the current PT trajectory.

**Prototype**

```c
int MultipleAxesPTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**

- **FileName** char * Currently executing trajectory file name.
- **CurrentElementNumber** int * Currently executing element number.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
- -22: Not allowed action.
7.2.1.155 **MultipleAxesPTPulseOutputGet**

**Name**

**MultipleAxesPTPulseOutputGet** – Gets the configuration of pulse generation for PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)

**Description**

This function returns the last configuration of pulse generation of a PT trajectory, that was previously set by **MultipleAxesPTPulseOutputSet()**.

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

**Example:**

```c
MultipleAxesPTPulseOutputSet(MyGroup, 3, 5, 0.01)
```

```c
MultipleAxesPTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is the error return, meaning ” no error ”)
```

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

- Start element = 3
- End element = 5
- Time interval = 0.01 seconds.

**Prototype**

```c
int MultipleAxesPTPulseOutputGet(
    int SocketID,
    char GroupName[250],
    int * StartElement,
    int * EndElement,
    double * TimeInterval
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**

- **StartElement** int * Start pulse element number.
- **EndElement** int * End pulse element number.
- **TimeInterval** double * Time interval between pulses (seconds).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
7.2.1.156 **MultipleAxesPTPulseOutputSet**

**Name**

*MultipleAxesPTPulseOutputSet* – Sets the configuration of pulse generation for PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)

**Description**

This function configures and activates the pulse generation of a PT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PT trajectory then this function returns error -22 (“Not allowed action”).

Please note, that the pulse output settings are automatically removed, when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PT trajectory. The pulses are generated between the first and the last trajectory element. The minimum possible time interval is CorrectorISRPeriod value (system.ref).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to Appendix / General I/O Description of XPS User’s Manual.

**Example:**

*MultipleAxesPTPulseOutputSet*(Group1, 3, 5, 0.01)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

**Prototype**

```c
int MultipleAxesPTPulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
```
**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char*: Group name.
- **StartElement** int: Start pulse element number.
- **EndElement** int: End pulse element number.
- **TimeInterval** double: Time interval between pulses (seconds).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-22:** Not allowed action.
7.2.1.157 **MultipleAxesPTResetInMemory** [Extended]

**Name**

MultipleAxesPTResetInMemory – Deletes the content of PT trajectory buffer in the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function deletes the PT trajectory buffer, that was previously loaded with “MultipleAxesPTLoadToMemory” function, in the controller memory.

**Prototype**

```c
int MultipleAxesPTResetInMemory(
    int SocketID,
    char GroupName[250]
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-3:** String too long.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-24:** Not available in this configuration.
7.2.1.158 MultipleAxesPTVerification

**Name**

MultipleAxesPTVerification – Checks the PT trajectory data file.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must \(\leq 250\)): (-3)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory (number of elements must >0): (-66)
- Checks velocity (Minimum Velocity \(\leq\)Velocity \(\leq\)Maximum Velocity): (-68)
- Checks acceleration (Minimum acc. \(\leq\)acceleration \(\leq\)Maximum acc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

**Description**

This function verifies the execution of a PT trajectory. The results of the verification can be obtained by “MultipleAxesPTVerificationResultGet” function. The trajectory file must be stored in “\ADMIN\Public\Trajectory” folder of XPS controller. If the trajectory cannot be initialized (task error), error (-72) is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:

- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, 1) the required travel per positioner, 2) the maximum possible trajectory velocity and 3) the maximum possible trajectory acceleration. This function helps to define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero and not to the current position. So before executing a PT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

**NOTES**

Because of the PT trajectory internal calculation of elements end velocity, a correct PT trajectory file must have at least two lines with zero displacements at the trajectory end. Otherwise, the “MultipleAxesPTVerification” function returns error (-70).

The “MultipleAxesPTVerification” function is independent from the “MultipleAxesPTExecution” function, but it is highly recommended to execute this function before executing the PT trajectory.
Prototype

int MultipleAxesPTVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)

Input parameters

<table>
<thead>
<tr>
<th>SocketID</th>
<th>int</th>
<th>Socket identifier gets by the “TCP_ConnectToServer” function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>FileName</td>
<td>char *</td>
<td>Trajectory file name.</td>
</tr>
</tbody>
</table>

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -61: Error file corrupt or file doesn't exist.
- -66: Trajectory doesn't content any element.
- -68: Acceleration on trajectory is too big.
- -69: Acceleration on trajectory is too big.
- -70: Final velocity on trajectory is not zero.
- -72: Error trajectory initialization.
- -75: Trajectory element has a negative or null delta T.
7.2.1.159 **MultipleAxesPTVerificationResultGet**

**Name**

MultipleAxesPTVerificationResultGet – Gets the results of the “MultipleAxesPTVerification” function.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last MultipleAxes PTVerification (must be done): (-22)

**Description**

This function returns the results of the previous “MultipleAxesPTVerification” function, for every positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done, error (-22) is returned.

**Prototype**

```c
int MultipleAxesPTVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**

- **SocketID**
  int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  char * Positioner name.

**Output parameters**

- **TrajectoryFileName**
  char * Examined trajectory file name.
- **MinimumPosition**
  double * Minimum position (units).
- **MaximumPosition**
  double * Maximum position (units).
- **MaximumVelocity**
  double * Maximum velocity (units/s).
- **MaximumAcceleration**
  double * Maximum acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.160 **MultipleAxesPVTExecution**

**Name**

*MultipleAxesPVTExecution* – Executes a PVT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)

**Description**

This function executes a PVT (Position Velocity Time) trajectory. The trajectory file must be stored in “\Admin\Public\Trajectory” folder of XPS controller. If the trajectory cannot be initialized (message queue or task error), error (-72) is returned.

Before the trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “MultipleAxesPVTVerification” and “MultipleAxesPVTVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of its travel limits, the trajectory execution stops and error (-25) error is generated under positioner errors.

---

**NOTE**

In case of errors (-33), (-25) and (-44), the group state changes to DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

**Prototype**

```c
int MultipleAxesPVTExecution(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    int ExecutionNumber
)
```

**Input parameters**

- **SocketID**: int, Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *, Group name.
- **FileName**: char *, Trajectory file name.
- **ExecutionNumber**: int, Number of trajectory executions.
Output parameters
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.161 **MultipleAxesPVTLoadToMemory** [Extended]

**Name**

**MultipleAxesPVTLoadToMemory** – Loads some lines of PVT trajectory to the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and ≤400): (-3) or (-17)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function loads some lines of PVT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “|” and “n” two successive characters). To verify or to execute the PVT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

**NOTES**

All of the PVT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PVT trajectory in RAM as it does from a disk.

*Example:*

```c
MultipleAxesPVTLoadToMemory(socketId,myGroup,"dT1,dX11,Vout11,dX12,Vout12#…dTn,dXn1,Voutn1,dXn2,Voutn2#")
```

`MultipleAxesPVTVerification (socketId,myGroup,FromMemory)`

`MultipleAxesPVTExecution(socketId,myGroup,FromMemory,1).`

**Prototype**

```c
int MultipleAxesPVTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char TrajectoryData[400]
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **TrajectoryData** char * Trajectory data lines.

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.162 `MultipleAxesPVTParametersGet`

**Name**

`MultipleAxesPVTParametersGet` – Gets PVT trajectory parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PVT): (-22)

**Description**

This function returns the PVT trajectory parameters (trajectory name and current executing element number) of the current PVT trajectory.

**Prototype**

```c
int MultipleAxesPVTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
)
```

**Input parameters**

- **SocketID** int `Socket identifier gets by the “TCP_ConnectToServer” function.`
- **GroupName** char * `Group name.`

**Output parameters**

- **FileName** char * `Currently executing trajectory file name.`
- **CurrentElementNumber** int * `Currently executing element number.`

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-22:** Not allowed action.
7.2.1.163 MultipleAxesPVTPulseOutputGet

**Name**

*MultipleAxesPVTPulseOutputGet* – Gets the configuration of pulse generation for PVT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)

**Description**

This function returns the last configuration of pulse generation for a PVT trajectory, that was previously set by *MultipleAxesPVTPulseOutputSet()*.

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

**Example:**

*MultipleAxesPVTPulseOutputSet(MyGroup, 3, 5, 0.01)*

*MultipleAxesPVTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is error return, means OK)*

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

Start element = 3
End element = 5
Time interval = 0.01 seconds.

**Prototype**

```c
int MultipleAxesPVTPulseOutputGet(
    int SocketID,
    char GroupName[250],
    int * StartElement,
    int * EndElement,
    double * TimeInterval
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.

**Output parameters**

- **StartElement**: int * Start pulse element number.
- **EndElement**: int * End pulse element number.
- **TimeInterval**: double * Time interval between pulses (seconds).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
7.2.1.164 MultipleAxesPVTPulseOutputSet

**Name**

MultipleAxesPVTPulseOutputSet – Sets the configuration of pulse generation for PVT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)

**Description**

This function configures and activates the pulse generation of a PVT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PVT trajectory, error (-22) is returned.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PVT trajectory. The pulses are generated between the first and the last trajectory elements. The minimum possible time interval is CorrectorISRPeriod value (system.ref).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual.

**Example:**

MultipleAxesPVTPulseOutputSet(Group1, 3, 5, 0.01)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

**Prototype**

```c
int MultipleAxesPVTPulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
```
### Input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>StartElement</td>
<td>int</td>
<td>Start pulse element number.</td>
</tr>
<tr>
<td>EndElement</td>
<td>int</td>
<td>End pulse element number.</td>
</tr>
<tr>
<td>TimeInterval</td>
<td>double</td>
<td>Time interval between pulses (seconds).</td>
</tr>
</tbody>
</table>

### Output parameters

None.

### Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.165 MultipleAxesPVTResetInMemory [Extended]

Name
MultipleAxesPVTResetInMemory – Deletes the content of the PVT trajectory buffer in the controller memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function deletes the PVT trajectory buffer, that was previously loaded with the “MultipleAxesPVTLoadToMemory” function, from the controller memory.

Prototype

```c
int MultipleAxesPVTResetInMemory(
    int SocketID,
    char GroupName[250]
)
```

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.166 MultipleAxesPVTVerification

Name

MultipleAxesPVTVerification – Checks the PVT trajectory data file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤250): (-3)
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory (number of elements must >0): (-66)
- Checks velocity (Minimum Velocity ≤Velocity ≤Maximum Velocity): (-68)
- Checks acceleration (Minimum acc. ≤acceleration ≤Maximum acc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

Description

This function verifies the execution of the PVT trajectory. The results of the verification can be obtained by “MultipleAxesPVTVerificationResultGet” function. The trajectory file must be stored in “\ADMIN\Public\Trajectory” folder of the XPS controller. If the trajectory cannot be initialized (task error), error (-72) is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:

- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, 1) the required travel per positioner, 2) the maximum possible trajectory velocity and 3) the maximum possible trajectory acceleration. This function helps to define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero and not to the current position. So before executing a PVT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

NOTE

The “MultipleAxesPVTVerification” function is independent from the “MultipleAxesPVTExecution” function, but it is highly recommended to execute this function before executing a PVT trajectory.
Prototype

```c
int MultipleAxesPVTVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.
- **FileName**
  - char *
  - Trajectory file name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  - No error.
- **-3:**
  - String too long.
- **-8:**
  - Wrong object type for this command.
- **-19:**
  - Group name doesn't exist or unknown command.
- **-61:**
  - Error file corrupt or file doesn't exist.
- **-66:**
  - Trajectory doesn't content any element.
- **-68:**
  - Acceleration on trajectory is too big.
- **-69:**
  - Acceleration on trajectory is too big.
- **-70:**
  - Final velocity on trajectory is not zero.
- **-72:**
  - Error trajectory initialization.
- **-75:**
  - Trajectory element has a negative or null delta T.
7.2.1.167 **MultipleAxesPVTVerificationResultGet**

**Name**

`MultipleAxesPVTVerificationResultGet` – Gets the results of the “MultipleAxesPVTVerification” function.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last MultipleAxes PVTVerification (must be done): (-22)

**Description**

This function returns the results of the previous “MultipleAxesPVTVerification” function, for every positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration. If no verification was previously done, error (-22) is returned.

**Prototype**

```c
int MultipleAxesPVTVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**

- **TrajectoryFileName** char * Examined trajectory file name.
- **MinimumPosition** double * Minimum position (units).
- **MaximumPosition** double * Maximum position (units).
- **MaximumVelocity** double * Maximum velocity (units/s).
- **MaximumAcceleration** double * Maximum acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-3**: String too long.
- **-18**: Positioner name doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.1.168 MultipleAxesDisableShutter [Extended]

Name

MultipleAxesDisableShutter – disables the shutter.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Check shutter existence (-22)
- Checks group status must be "READY": (-22 otherwise)

Description
This function forces the group in “ready” state if its status is in “shutter enable” state.

Prototype
int MultipleAxesDisableShutter ( 
        int SocketID,
        char GroupName[250]
    )

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.169 **MultipleAxesScanPositions [Extended]**

**Name**

**MultipleAxesScanPositions** – Set the new scan positions.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Check shutter group existence (-22)
- Check parameter values coherence (-17 or -68)
- Checks group status must be "READY": (-22 otherwise)

**Description**

This function sets the shutter new scan positions before making a shutter scan.

**Prototype**

```c
int MultipleAxesScanPositions (  
    int SocketID,  
    char GroupName[250],  
    double XStartOpeningPosition,  
    double XStartOpeningVelocity,  
    double XEndOpeningPosition,  
    double XEndOpeningVelocity,  
    double XStartClosingPosition,  
    double XStartClosingVelocity,  
    double XEndClosingPosition,  
    double XEndClosingVelocity,  
    double BeamOpeningPercentage  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **XStartOpeningPosition** double X start opening position.
- **XStartOpeningVelocity** double X start opening velocity.
- **XEndOpeningPosition** double X end opening position.
- **XEndOpeningVelocity** double X end opening velocity.
- **XStartClosingPosition** double X start closing position.
- **XStartClosingVelocity** double X start closing velocity.
- **XEndClosingPosition** double X end closing position.
- **XEndClosingVelocity** double X end closing velocity.
- **BeamOpeningPercentage** double Laser beam opening percentage.

**Output parameters**
None.

**Return** (In addition to the results of “*Input Tests Common to all XPS Functions*”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter is out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -68: Velocity on trajectory is too big.
### 7.2.1.170 MultipleAxesGetShutterPositions [Extended]

#### Name

**MultipleAxesGetShutterPositions** – gets shutter positions.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)

#### Description

This function gets positions of the shutter.

#### Prototype

```c
int MultipleAxesGetShutterPositions (  
    int SocketID,  
    char GroupName[250],  
    double * BeamBlockMin,  
    double * BeamBlockMax,  
    double * ShutterPosition2,  
    double * ShutterPosition3,  
    double * ShutterPosition4,  
    double * ShutterPosition5
)
```

#### Input parameters

- **SocketID**
  - int  
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**
  - char *  
  - Group name.

#### Output parameters

- **BeamBlockMin**
  - double *  
  - Beam block minimum position.

- **BeamBlockMin**
  - double *  
  - Beam block maximum position.

- **ShutterPosition2**
  - double *  
  - Shutter position 2

- **ShutterPosition3**
  - double *  
  - Shutter position 3

- **ShutterPosition4**
  - double *  
  - Shutter position 4

- **ShutterPosition5**
  - double *  
  - Shutter position 5

#### Return

(In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
7.2.1.171 **MultipleAxesSetShutterPositions [Extended]**

**Name**

**MultipleAxesSetShutterPositions** – sets shutter positions.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Check parameter values coherence (-17)

**Description**

This function sets shutter new positions.

**Prototype**

```
int MultipleAxesSetShutterPositions (  
    int SocketID,
    char GroupName[250],
    double BeamBlockMin,
    double BeamBlockMax,
    double ShutterPosition2,
    double ShutterPosition3,
    double ShutterPosition4,
    double ShutterPosition5
)
```

**Input parameters**

- **SocketID** int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *  
  Group name.
- **BeamBlockMin** double  
  Beam block minimum position.
- **BeamBlockMax** double  
  Beam block maximum position.
- **ShutterPosition2** double  
  Shutter position 2
- **ShutterPosition3** double  
  Shutter position 3
- **ShutterPosition4** double  
  Shutter position 4
- **ShutterPosition5** double  
  Shutter position 5

**Output parameters**

None

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.172 **MultipleAxesTraceNextScan**  [Extended]

**Name**

**MultipleAxesTraceNextScan** – Trace the next scan.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a MultipleAxes group): (-8)
- Checks group name: (-19)
- Check shutter group existence (-22)

**Description**
This function enables trajectory trace during the next scan.

**Prototype**

```c
int MultipleAxesTraceNextScan (  
    int SocketID,  
    char GroupName[250]  
)
```

**Input parameters**

- SocketID: int, Socket identifier gets by the “TCP_ConnectToServer” function.
- GroupName: char *, Group name.

**Output parameters**
None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.173 OpenConnection

Name
OpenConnection – opens a socket to connect to TCP server (local).

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of used sockets (Max = 100): if no free socket then the SocketID is set to -1.

Description
This function opens a socket in a TCL script located in the “Scripts” directory of the XPS controller.
The TCP/IP communication is configured as:
- Local Host Address = 127.0.0.1
- IP Port = 5001
This function returns a socket identifier to use for each function call. The socket identifier is defined between 0 to 99. If the TCP/IP connection fails then the “SocketID” value is –1.

Prototype
int OpenConnection(
    int TimeOut,
    int SocketID
)

Input parameters
TimeOut int Timeout in seconds used for each function execution.
SocketID int Socket identifier used in each function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.1.174 **PositionerAccelerationAutoScaling**

**Name**

**PositionerAccelerationAutoScaling** – Executes Auto-scaling process to determine the stage scaling acceleration.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner”: (-8)
- Checks group type: (-8)
- Checks positioner name: (-18)
- Group status must be not initialized: (-22)
- Control loop type must be “PIDFFAcceleration”: (-24)

**Description**

This function executes an auto-scaling process and returns the calculated scaling acceleration. The selected group must be in “NOTINIT” state, otherwise error (-22) is returned.

It only works, if the positioner control loop type is “PIDFFAcceleration” (acceleration control), otherwise error (-24) is returned.

This function checks the positioner error. If an error is detected, the hardware status register is reset (motor on) and the positioner error is cleared before checking it again. If a positioner error is present, the motor is turned off, error (-5) is returned and the group status becomes “NOTINIT”.

If there is no positioner error, then the master-slave error is cleared, the encoder is preset (update encoder position) and the user travel limits are checked. If a travel limit error is detected then the motor is turned off, error (-35) is returned and the group status becomes “NOTINIT”.

If no error is detected, the motor initializes. If motor initialization fails, the error (-50) is returned and the group status becomes “NOTINIT”.

If motor initialization is successful, the positions are preset, the motion is enabled (the motor is powered) permitting the process to auto-scale if the motion cannot be enabled, error (-22) is returned.

If the auto-scaling fails error (-105) is returned or if the motion becomes disabled, error (-26) is returned.

The auto-scaling process is executed in 5 periods. At the end of each period, the auto-scaling process estimates the auto-scaling quality by calculating the signal to noise ratio. If it is very close to zero, it means there is no oscillation, so error (-101) is returned. If the signal to noise ratio > MaximumNoiseRatio defined in system.ref (normally between 0.1 and 0.2), error (-102) is returned.

If the number of acquired data points (minimum = 9) or the number of acquired signal periods (minimum = 5) is not enough for a good estimate then error (-103) is returned.

At the end of this function, the new value of scaling acceleration is returned and the group status becomes “NOTINIT” once again.
Prototype

```c
int PositionerAccelerationAutoScaling(
    int SocketID,
    char * PositionerName,
    double * Scaling
)
```

**Input parameters**
- **SocketID**
  - `int`: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - `char *`: Name of a positioner.
- **FrequencyTicks**
  - `int`: Number of frequency ticks.

**Output parameters**
- **Scaling**
  - `double *`: Calculated scaling acceleration value.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-5**: Not allowed due to a positioner error or hardware status.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-24**: Not available in this configuration (check hardware or configuration).
- **-35**: Position is outside of travel limits.
- **-50**: Motor initialization error. Check InitializationAccelerationLevel, ScalingAcceleration, MaximumJerkTime, EncoderResolution or EncoderScalePitch.
- **-101**: Relay Feedback Test failed: No oscillation.
- **-102**: Relay Feedback Test failed: Signal too noisy.
- **-103**: Relay Feedback Test failed: Signal data not enough for analyse.
- **-105**: Error of scaling calibration initialization.
7.2.1.175 \texttt{PositionerAnalogTrackingPositionParametersGet}

\textbf{Name}

\texttt{PositionerAnalogTrackingPositionParametersGet} – Gets the parameters of the current tracking position mode.

\textbf{Input tests}

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter: (-8), (-18)

\textbf{Description}

This function returns the current analog input name, the current offset and the current scale used by analog tracking position mode.

\textbf{NOTE}

“Velocity” and “Acceleration” define the maximum velocity and acceleration used in the position tracking mode.

\textbf{Prototype}

\begin{verbatim}
int PositionerAnalogTrackingPositionParametersGet(
    int SocketID,
    char * FullPositionerName,
    char * GPIOName,
    double * Offset,
    double * Scale,
    double * Velocity,
    double * Acceleration
)
\end{verbatim}

\textbf{Input parameters}

- \texttt{SocketID} \hspace{1cm} int \hspace{1cm} Socket identifier gets by the “TCP_ConnectToServer” function.
- \texttt{FullPositionerName} \hspace{1cm} char * \hspace{1cm} Positioner name FrequecyTicks.

\textbf{Output parameters}

- \texttt{GPIOName} \hspace{1cm} char \hspace{1cm} Analog input name (ADC).
- \texttt{Offset} \hspace{1cm} double * \hspace{1cm} Offset in volts.
- \texttt{Scale} \hspace{1cm} double * \hspace{1cm} Scale (Units/Volts).
- \texttt{Velocity} \hspace{1cm} double * \hspace{1cm} Velocity (Units/s).
- \texttt{Acceleration} \hspace{1cm} double * \hspace{1cm} Acceleration (Units/s²).

\textbf{Return} (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: \hspace{1cm} No error.
- -8: \hspace{1cm} Wrong object type for this command.
7.2.1.176 PositionerAnalogTrackingPositionParametersSet

**Name**

PositionerAnalogTrackingPositionParametersSet – Sets the parameters of the current tracking position mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Positioner and GPIO type (ADC): (-8)
- Checks velocity and acceleration: (-17)
- Checks input parameter: (-18)

**Description**

This function modifies the analog input name, the offset and the scale used by the analog tracking position mode. To use this function, the group state must be READY otherwise error (-22) is returned.

The “Offset” and the “Scale” parameters are used to calculate the target tracking position:

\[ \text{TrackingPosition} = \text{InitialPosition} + (\text{AnalogValue} - \text{Offset}) \times \text{Scale} \]

The “Velocity” and “Acceleration” parameters define the maximum velocity and acceleration used in the position tracking mode.

---

**NOTE**

The parameters for analog tracking position mode can be reset, if the “GPIOName” parameter is blank.

**Prototype**

```c
int PositionerAnalogTrackingPositionParametersSet(
    int SocketID,
    char FullPositionerName,
    char * GPIOName,
    double Offset,
    double Scale,
    double Velocity,
    double Acceleration
)
```

**Input parameters**

- **SocketID** (int) – Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** (char) – Positioner name FrequencyTicks.
- **GPIOName** (char *) – Analog input name (ADC).
- **Offset** (double) – Offset in volts.
- **Scale** (double) – Scale (Units/Volts).
- **Velocity** (double) – Velocity (Units/s).
- **Acceleration** (double) – Acceleration (Units/s²).
**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn’t exist or unknown command.
- **-22:** Not allowed action.
### 7.2.1.177 PositionerAnalogTrackingVelocityParametersGet

**Name**

*PositionerAnalogTrackingVelocityParametersGet* – Gets the parameters of the current tracking velocity mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter: (-8), (-18)

**Description**

This function returns the analog input name, the offset, the scale, the deadband threshold and the order used by analog tracking velocity mode.

**NOTE**

“Velocity” and “Acceleration” define the maximum velocity and acceleration used in the velocity tracking mode.

**Prototype**

```c
int PositionerAnalogTrackingVelocityParametersGet(
    int SocketID,
    char FullPositionerName,
    char * GPIOName,
    double * Offset,
    double * Scale,
    double * DeadBandThreshold,
    int * Order,
    double * Velocity,
    double * Acceleration
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char *
  - Positioner name FrequencyTicks.

**Output parameters**

- **GPIOName**: char *
  - Analog input name (ADC).
- **Offset**: double *
  - Offset in volts.
- **Scale**: double *
  - Scale (Units/Volts).
- **DeadBandThreshold**: double *
  - Dead band threshold (Volts).
- **Order**: integer *
  - Order (No unit).
- **Velocity**: double *
  - Velocity (Units/s).
- **Acceleration**: double *
  - Acceleration (Units/s²).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.178 `PositionerAnalogTrackingVelocityParametersSet`

**Name**

`PositionerAnalogTrackingVelocityParametersSet` – Sets the parameters of the current tracking velocity mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks GPIO type (ADC): (-8)
- Checks Positioner: (-8), (-18)
- Checks velocity and acceleration: (-17)

**Description**

This function allows modifying the GPIO name, offset, scale, deadband threshold and the order used by analog tracking velocity mode. To use this function the group state must be READY, otherwise error (-22) is returned.

The “velocity” and “acceleration” define the maximum velocity and acceleration used in the velocity tracking mode.

The target tracking velocity is defined as follows:

\[
\text{InputValue} = \text{GPIOAnalogInput} - \text{Offset}
\]

\[
\text{MaxADCAmplitude} = \frac{10}{\text{GPIOAnalogGain}}
\]

if \((\text{InputValue} \geq 0)\) then

\[
\text{InputValue} = \text{InputValue} - \text{DeadBandThreshold}
\]

if \((\text{InputValue} < 0)\) then \(\text{InputValue} = 0\)

else

\[
\text{InputValue} = \text{AnalogInputValue} + \text{DeadBandThreshold}
\]

if \((\text{InputValue} > 0)\) then \(\text{InputValue} = 0\)

\[
\text{OutputValue} = (|\text{InputValue}|/\text{MaxADCAmplitude})^{\text{Order}}
\]

\[
\text{TrackingVelocity} = \text{Sign(InputValue)} \times \text{OutputValue} \times \text{Scale} \times \text{MaxADCAmplitude}
\]

**NOTE**

The analog tracking velocity mode can be reset if the “GPIOName” parameter is blank.

**Prototype**

```c
int PositionerAnalogTrackingVelocityParametersSet(
    int SocketID,
    char * FullPositionerName,
    char * GPIOName,
    double Offset,
    double Scale,
    double DeadBandThreshold,
    int Order,
    double Velocity,
    double Acceleration
)
```
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the TCP_ConnectToServer function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name FrequencyTicks.</td>
</tr>
<tr>
<td>GPIOName</td>
<td>char *</td>
<td>Analog input name (ADC).</td>
</tr>
<tr>
<td>Offset</td>
<td>double</td>
<td>Offset in volts.</td>
</tr>
<tr>
<td>Scale</td>
<td>double</td>
<td>Scale (Units/Volts).</td>
</tr>
<tr>
<td>Order</td>
<td>integer</td>
<td>Order (No unit).</td>
</tr>
<tr>
<td>Velocity</td>
<td>double</td>
<td>Velocity (Units/s).</td>
</tr>
<tr>
<td>Acceleration</td>
<td>double</td>
<td>Acceleration (Units/s²).</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.179 **PositionerBacklashDisable**

**Name**

*PositionerBacklashDisable* – Disables the backlash compensation.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)

**Description**

This function disables the backlash compensation.

In the “stages.ini” file the parameter “Backlash” will enable or disable this feature as follows:

- Backlash = 0 —> Disable backlash
- Backlash >0 —> Enable backlash

---

**NOTE**

The backlash compensation is not allowed with a secondary positioner (gantry mode).

The backlash must be disabled to execute a trajectory, use a jog mode or analog tracking mode.

---

**Prototype**

```c
int PositionerBacklashDisable(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

- **SocketID**: int, Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char *, Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.180 PositionerBacklashEnable

Name
PositionerBacklashEnable – Enables the backlash compensation.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group status must be “NOTINIT”: (-22)
- Checks the positioner type (must not be a secondary positioner): (-8)

Description
This function enables the backlash compensation defined in the “stages.ini” file or by “PositionerBacklashSet” function. If the backlash compensation value is null then this function will have no effect, and backlash compensation will remain disabled.
The group state must be NOTINIT to enable the backlash compensation. If it is not the case error (-22) is returned.
The parameter “Backlash in the “stages.ini” file” allows the user to enable or disable the backlash compensation.

<table>
<thead>
<tr>
<th>Backlash</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>= 0</td>
<td>Disable backlash</td>
</tr>
<tr>
<td>&gt; 0</td>
<td>Enable backlash</td>
</tr>
</tbody>
</table>

NOTE
The backlash must be disabled to execute a trajectory use the jog mode or analog tracking mode.

CAUTION
It is not possible to use backlash compensation with positioners that have one of the following:
1) “HomeSearchSequenceType” defined as “CurrentPositionAsHome”
2) “PositionerMappingFileName” defined in the stages.ini file.

Prototype
int PositionerBacklashEnable(
    int SocketID,
    char * FullPositionerName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -22: Not allowed action.
7.2.1.181 PositionerBacklashGet

Name
PositionerBacklashGet – Gets the backlash compensation value.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)

Description
This function returns the backlash compensation value, defined in the “stages.ini” file or by “PositionerBacklashSet” function, and the backlash status (“Enable” or “Disable”).

Prototype
int PositionerBacklashGet(
    int SocketID,
    char * FullPositionerName,
    double * BacklashValue,
    char * Status
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
BacklashValue double * Backlash compensation value (units).
Status char * Backlash status (“Enable” or “Disable”).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.182 PositionerBacklashSet

**Name**
PositionerBacklashSet – Sets the backlash compensation value.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- The “BacklashValue” must be positive: (-17)

**Description**
This function changes the backlash compensation value.

---

**NOTE**
This function can be used only if a backlash compensation is defined in “stages.ini” file (Backlash >0), otherwise error (-22) is returned.

**Prototype**
```c
int PositionerBacklashSet(
    int SocketID,
    char * FullPositionerName,
    double BacklashValue
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **BacklashValue** double Backlash compensation value (units).

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
7.2.1.183 **PositionerCompensatedFastPCOAbort**

**Name**

*PositionerCompensatedFastPCOAbort* – Aborts the CIE fast compensated PCO pulses generation.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)

**Description**

This function aborts the CIE fast compensated PCO pulses generation. The pulses generation is stopped immediately; no more pulses will be generated even if the scanning positioner continues to move across the predefined firing positions. To stop the scanning move, use GroupMoveAbort() function.

**Prototype**

```c
int PositionerCompensatedFastPCOAbort(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

- `SocketID`: int Socket identifier gets by the “TCP_ConnectToServer” function.
- `FullPositionerName`: char * Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
7.2.1.184 PositionerCompensatedFastPCOCurrentStatusGet

Name

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

Description

This function gets the current status of CIEFAST compensated PCO pulses generation.

Status possible values:
0: Pulses generation inactive (idle, no error)
1: Pulses generation activated (running)
-1: Pulses generation aborted with errors.

Prototype

int PositionerCompensatedFastPCOCurrentStatusGet(
    int SocketID,
    char * FullPositionerName,
    int * Status
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters

Status int * PCO pulses generation status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Function is not allowed due to configuration disabled.
7.2.1.185 PositionerCompensatedFastPCOEnable

Name

PositionerCompensatedFastPCOEnable – Activates the CIEFAST compensated PCO pulses generation.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

Description

This function activates the CIE Fast compensated PCO pulses generation (status becomes running (value 1)). The pulses will be generated when the scanning positioner moves across the predefined positions. When the last pulse is generated, the CIE Fast compensated PCO mode will become inactive (status becomes inactive (value 0)). To get status of the CIE Fast compensated PCO pulses generation, use PositionerCompensatedFastPCOCurrentStatusGet() function.

Note that only the scanning positioner positions are used to fire pulses: if you prepare a set of positions at a given location and then enable the pulses generation and start the move from a different location, the pulses could be generated but their accuracy will be impacted by the mapping difference between the two locations.

This function must be used after the firing pulses data preparation with the PositionerCompensatedFastPCOPrepare(), elsewhere the function fails and the error (-122) will be returned.

Prototype

int PositionerCompensatedFastPCOEnable(
    int SocketID,
    char * FullPositionerName
)

Input parameters

SocketAddress int Socket identifier gets by the “TCP_ConnectToServer” function.

FullPositionerName char * Positioner name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -115: Function is not supported by current hardware.
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.186 PositionerCompensatedFastPCOFromFile

Name
PositionerCompensatedFastPCOFromFile – Reads firing positions from a data file to controller’s memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

Description
This function reads firing positions from a data file to the controller’s memory.
The data file contains lines of data, formatted as follows:

Position_i

Example:
Position_1
Position_2
...
Position_N

Data conditions:
Position_i >Position_{i-1}, Width_i <Position_{i+1} - Position_i.

NOTE
Position_i (i = 1…N) are the offset values relative to the scanning positioner start position that is defined in the PositionerCompensatedFastPCOPrepare().

Prototype

```c
int PositionerCompensatedFastPCOFromFile(
    int SocketID,
    char * PositionerName,
    char * DataFileName
)
```

Input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>PositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
<tr>
<td>DataFileName</td>
<td>char *</td>
<td>Data file name.</td>
</tr>
</tbody>
</table>

Output parameters

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -61: Error file corrupt or file doesn't exist.
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.187 **PositionerCompensatedFastPCOLoadToMemory**

**Name**

`PositionerCompensatedFastPCOLoadToMemory`— Appends firing positions to controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

**Description**

This function appends firing positions to controller memory from input parameters. To reset the controller memory, the `PositionerCompensatedFastPCOMemoryReset()` function is provided.

The data line format can be a single or several offset positions as in `PositionerCompensatedFastPCOSet()` function:

**Example:**

```
Position_i
Position_i+1 Position_i+2
PositionerCompensatedLoadToMemory(XY.X, 0 0.1 0.2 0.3 0.4 0.5)
```

**Prototype**

```c
int PositionerCompensatedFastPCOLoadToMemory(
    int SocketID,
    char * PositionerName,
    char * DataLine
)
```

**Input parameters**

- **SocketID**
  - `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - `char *` Positioner name.
- **DataLine**
  - `char *` Some data lines.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-22:** Not allowed action.
- **-121:** Function is not allowed due to configuration disabled.
- **-122:** Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.188 PositionerCompensatedFastPCOMemoryReset

**Name**

*PositionerCompensatedFastPCOMemoryReset* – Resets CIEFast compensated PCO data memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

**Description**

This function resets the CIE fast compensated PCO data memory. This function is useful to remove the data that was previously entered with the *PositionerCompensatedFastPCOLoadToMemory()* function.

**Prototype**

```c
int PositionerCompensatedFastPCOMemoryReset(
    int SocketID,
    char * PositionerName
)
```

**Input parameters**

- **SocketID** : int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** : char * Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-121**: Function is not allowed due to configuration disabled.
7.2.1.189 PositionerCompensatedFastPCOPrepare

Name

PositionerCompensatedFastPCOPrepare – Prepares data for CIEFast compensated PCO pulses generation.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks direction value: (-17)
- Checks the positioner name: (-18)
- Checks if first and last PCO positions are within positions limits: (-35)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)

Description

This function calculates the firing for absolute positions, in user’s coordinate system and converts them to firing absolute raw PCO positions, in encoder’s coordinate system. It will use the supplied start positions and the offset positions set with PositionerCompensatedFastPCOSet() or PositionerCompensatedFastPCOFromFile() or PositionerCompensatedFastPCOLoadToMemory() function.

When mappings are enabled, the correction between user’s coordinate system position and raw encoder position will be different at each location. For this reason, the prepare function must know the location (positions of all positioners in the scanning group) where the scan will be done.

This function must be called before the use of PositionerCompensatedFastPCOEnable() function.

Parameters:

- ScanDirection: Scan direction, (value: 1 (positive) or -1 (negative)).
- StartPosition1: Group 1st positioner start position
- StartPosition2: Group 2nd positioner start position
- StartPosition3: Group 3rd positioner start position
- …… etc ……

Prototype

int PositionerCompensatedFastPCOPrepare(
    int SocketID,
    char * PositionerName
int ScanDirection,
    double StartPosition1,
    double StartPosition2,
    double StartPosition3,
    …
)
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>PositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
<tr>
<td>ScanDirection</td>
<td>int</td>
<td>Scan direction (1 or -1).</td>
</tr>
<tr>
<td>StartPosition1</td>
<td>double</td>
<td>Group 1&lt;sup&gt;st&lt;/sup&gt; positioner start position (units).</td>
</tr>
<tr>
<td>StartPosition2</td>
<td>double</td>
<td>Group 2&lt;sup&gt;nd&lt;/sup&gt; positioner start position (units).</td>
</tr>
<tr>
<td>StartPosition3</td>
<td>double</td>
<td>Group 3&lt;sup&gt;rd&lt;/sup&gt; positioner start position (units).</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -35: Position is outside of travel limits.
- -115: Function is not supported by current hardware.
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.190 PositionerCompensatedFastPCOPulseParametersGet

**Name**
PositionerCompensatedFastPCOPulseParametersGet – Gets pulse configuration to compensated PCO.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks pulses generation status: (-22)
- Checks if CIEFAST compensated PCO pulses generation is supported: (-115)

**Description**
This function returns the set values of parameters: Pulse width, Pulse polarity and Pulse toggle.

**Prototype**
```c
int PositionerCompensatedFastPCOPulseParametersGet(
    int SocketID,
    char * PositionerName,
    double * PulseWidth,
    int * PulsePolarity,
    bool * PulseToggle
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**
- **PulseWidth** double * Width of pulse enable signal (units).
- **PulsePolarity** int *.
- **PulseToggle** bool *.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -115: Function is not supported by current hardware.
7.2.1.191 PositionerCompensatedFastPCOPulseParametersSet

Name
PositionerCompensatedFastPCOPulseParametersGet – Sets pulse configuration to compensated PCO.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks pulses generation status: (-22)
- Checks if CIEFAST compensated PCO pulses generation is supported: (-115)

Description
This function sets values of parameters: Pulse width, Pulse polarity and Pulse toggle.

Prototype
int PositionerCompensatedFastPCOPulseParametersGet(
    int SocketID,
    char * PositionerName,
    double PulseWidth,
    int PulsePolarity,
    bool PulseToggle
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PulseWidth double * Width of pulse enable signal (units).
PulsePolarity int *
PulseToggle bool *

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -115: Function is not supported by current hardware.
7.2.1.192 PositionerCompensatedFastPCOSet

**Name**

PositionerCompensatedFastPCOSet – Calculates a set of evenly spaced firing positions to the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Start <Stop, Step >0, and (Stop – Start) <Step: (-17)
- Checks the positioner name: (-18)
- Checks if CIEFAST compensated PCO pulses generation is enabled: (-121)
- Checks data number NData = floor(Stop - Start) / Step + 1, if NData >1000000: (-122)

**Description**

This function calculates a set of evenly spaced firing positions to the controller memory.

Parameters:

- Start: Relative offset where first PCO trigger is generated. Start must be less than Stop.
- Stop: Relative offset where last PCO pulses can be generated.
- Step: Distance between two consecutive pulses. Step must be positive.

This function will create a table of points that has as first point Start value and last point Stop value:

<table>
<thead>
<tr>
<th>Index</th>
<th>Start</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Start</td>
</tr>
<tr>
<td>1</td>
<td>Start + Step</td>
</tr>
<tr>
<td>2</td>
<td>Start + 2 * Step</td>
</tr>
<tr>
<td>3</td>
<td>Start + 3 * Step</td>
</tr>
<tr>
<td>4</td>
<td>Start + 4 * Step</td>
</tr>
<tr>
<td>…</td>
<td>…</td>
</tr>
<tr>
<td>N</td>
<td>Start + N * Step</td>
</tr>
</tbody>
</table>

**Example:**

Send PositionerCompensatedFastPCOSet(XY.X, 0, 10, 1) will generate points table below:

<table>
<thead>
<tr>
<th>Index</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>…</td>
<td>…</td>
</tr>
<tr>
<td>10</td>
<td>10</td>
</tr>
</tbody>
</table>
Prototype

```c
int PositionerCompensatedFastPCOSet(
    int SocketID,
    char * PositionerName,
    double Start,
    double Stop,
    double Step
)
```

Input parameters

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - char *
  - Positioner name.
- **Start**
  - double
  - Start position (units).
- **Stop**
  - double
  - Stop position (units).
- **Step**
  - double
  - Distance between two consecutive pulses (units).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:
  - No error.
- -8:
  - Wrong object type for this command.
- -17:
  - Parameter out of range or incorrect.
- -18:
  - Positioner Name doesn't exist or unknown command.
- -121:
  - Function is not allowed due to configuration disabled.
- -122:
  - Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.193 PositionerCompensatedPCOAbort [Extended - ISA]

**Name**

PositionerCompensatedPCOAbort – Aborts the CIE08 compensated PCO pulses generation.

**Input tests**

- Refers to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks the positioner name: (-18)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)

**Description**

This function aborts the CIE08 compensated PCO pulses generation. The pulses generation is stopped immediately; no more pulses will be generated even if the scanning positioner continues to move across the predefined firing positions. To stop the scanning move, use `GroupMoveAbort()` function.

---

**NOTE**

The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini: CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), elsewhere (-24) error is returned.

**Prototype**

```c
int PositionerCompensatedPCOAbort(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
</tbody>
</table>

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware
- -121: Function is not allowed due to configuration disabled.
7.2.1.194 PositionerCompensatedPCOCurrentStatusGet
[Extended - ISA]

Name

PositionerCompensatedPCOCurrentStatusGet – Gets current status of CIE08 compensated PCO pulses generation.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the positioner type: (-8)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)

Description

This function gets the current status of CIE08 compensated PCO pulses generation.

Status possible values:

- 0: Pulses generation inactive (idle, no error)
- 1: Pulses generation activated (running)
- -1: Pulses generation aborted with errors.

Prototype

```c
int PositionerCompensatedPCOCurrentStatusGet(
    int SocketID,
    char * FullPositionerName,
    int * Status
)
```

Input parameters

- **SocketID**
  int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  char * Positioner name.

Output parameters

- **Status**
  int * PCO pulses generation status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware
- -121: Function is not allowed due to configuration disabled.
7.2.1.195 **PositionerCompensatedPCOEnable**  [Extended - ISA]

**Name**

**PositionerCompensatedPCOEnable** – Activates the CIE08 compensated PCO pulses generation.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)
- Checks if data have been prepared by PositionerCompensatedPCOPrepare(): (-122)
- Checks current position is out and at the good side of scanning zone (left of scanning zone if ScanDirection positive, right of scanning zone if ScanDirection negative): (-22)
- Checks CIE08 compensated PCO mode is running: (-22)

**Description**

This function activates the CIE08 compensated PCO pulses generation (*status becomes running (value 1)*). The pulses will be generated when the scanning positioner moves across the predefined positions. When the last pulse is generated, the CIE08 compensated PCO mode will become inactive (*status becomes inactive (value 0)*). To get status of the CIE08 compensated PCO pulses generation, use `PositionerCompensatedPCOCurrentStatusGet()` function.

Note that only the scanning positioner positions are used to fire pulses: if you prepare a set of positions at a given location and then enable the pulses generation and start the move from a different location, the pulses could be generated but their accuracy will be impacted by the mapping difference between the two locations.

This function must be used after the firing pulses data preparation with the `PositionerCompensatedPCOPrepare()`, elsewhere the function fails and the error ERR_CHECK_DATA_INCORRECT (-122) will be returned. With XPS-Q if the settings are out of range, the user might experience pulses spaced unevenly without getting any error messages.

**NOTE**

The PCO pulses generation depends on the ScanVelocity and the pulse settling time (*set by PositionerPositionComparePulseParametersSet()*)

Valid settings are shown in the table below:

<table>
<thead>
<tr>
<th>Pulse settling time (µs)</th>
<th>PCO encoder frequency (kHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>25</td>
</tr>
<tr>
<td>0.075</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>OK</td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
</tbody>
</table>
How to determine the PCO encoder frequency:

- For AquadB encoder:
  \[ \text{PCO encoder frequency} = \frac{\text{Velocity}}{\text{EncoderResolution}} \]

- For analog interpolated encoder:
  \[ \text{PCO encoder frequency} = \frac{\text{Velocity} \times \text{HardInterpolatorFactor}}{\text{EncoderScalePitch}} \]

**Example:** XML310 stage (EncoderScalePitch=0.004 mm, HardInterpolatorFactor=200). With ScanVelocity=10mm/s \( \Rightarrow \) PCO encoder frequency \( = 10 \times 200 / 0.004 = 500 \text{ kHz} \)

**NOTE**

The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini: CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), otherwise (-24) error is returned.

**Prototype**

```
int PositionerCompensatedPCOEnable(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

- **SocketID**
  - int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - char *: Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-22:** Not allowed action.
- **-24:** Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- **-115:** Function is not supported by current hardware.
- **-121:** Function is not allowed due to configuration disabled.
- **-122:** Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.196 PositionerCompensatedPCOFromFile [Extended - ISA]

Name
PositionerCompensatedPCOFromFile – Reads firing positions from a data file to controller memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the positioner type: (-8)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)
- Checks data file exists: (-61)
- Checks data from file (must be PositionI > PositionI-1, WidthI < PositionI+1 - PositionI): (-122)

Description
This function reads firing positions from a data file to the controller memory. The data file contains lines of data, formatted as follows:

<table>
<thead>
<tr>
<th>PositionI</th>
<th>WidthI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position2</td>
<td>Width2</td>
</tr>
</tbody>
</table>

... ...

| PositionN | WidthN |

Data conditions: PositionI > PositionI-1, WidthI < PositionI+1 - PositionI

Example:
Position1Width1
Position2Width2

... ...

PositionNWidthN

NOTE
PositionI (i=1..N) are the offset values relative to the scanning positioner start position that is defined in the PositionerCompensatedPCOPrepare().

The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini: CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), otherwise (-24) error is returned.
Prototype

int PositionerCompensatedPCOFromFile(
    int SocketID,
    char * PositionerName,
    char * DataFileName
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

PositionerName char * Positioner name.

DataFileName char * Data file name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -61: Error file corrupt or file doesn't exist.
- -115: Function is not supported by current hardware
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.197 **PositionerCompensatedPCOLoadToMemory**

*Extended - ISA*

**Name**

*PositionerCompensatedPCOLoadToMemory* – Appends firing positions to controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the positioner type: (-8)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (*system.ini*): (-121)
- Checks data lines (must be Position\(_i\) > Position\(_{i-1}\), Width\(_i\) < Position\(_{i+1}\) - Position\(_i\)): (-122)

**Description**

This function appends firing positions to controller’s memory from *DataLines* parameter.

To reset the controller’s memory, the *PositionerCompensatedPCOMemoryReset()* function is provided.

The data line format must be:

```
Position\(_i\)<Space or Tabulation>Width\(_i\)<CRLF, LF or ;>
```

**Example :**

```
Position\(_1\),Width\(_1\)
Position\(_2\),Width\(_2\)
...
...
Position\(_N\),Width\(_N\)
```

Or :

```
Position\(_1\),Width\(_1\);Position\(_2\),Width\(_2\);...;Position\(_N\),Width\(_N\)
```

Data conditions: Position\(_i\) > Position\(_{i-1}\), Width\(_i\) < Position\(_{i+1}\) - Position\(_i\)

Example: Send PositionerCompensatedLoadToMemory (XY.X,0 0.1;1 0.1;2 0.1;3 0.1)

---

**NOTE**

Position\(_i\) (i=1..N) are the offset values relative to the scanning positioner start position that is defined in the PositionerCompensatedPCOPrepare().

The function works only when the CIE08 compensated PCO mode configuration is enabled (*system.ini*: CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), otherwise (-24) error is returned.
Prototype

```c
int PositionerCompensatedPCOLoadToMemory(
    int SocketID,
    char * PositionerName,
    char * DataLine
)
```

**Input parameters**

- **SocketID**
  - Type: int
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - Type: char *
  - Description: Positioner name.
- **DataLine**
  - Type: char *
  - Description: Some data lines.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.198 PositionerCompensatedPCOMemoryReset

[Extended - ISA]

Name
PositionerCompensatedPCOMemoryReset – Resets CIE08 compensated PCO data memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the positioner type: (-8)
- Checks the position encoder ("AquadB" or "AnalogInterpolated"): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)

Description
This function resets the CIE08 compensated PCO data memory. This function is useful to remove the data that was previously entered with the PositionerCompensatedPCOLoadToMemory() function.

NOTE
The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini: CIE08CompensatedPCOMode = Enabled).
This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), otherwise (-24) error is returned.

Prototype
int PositionerCompensatedPCOMemoryReset(  
    int SocketID,  
    char * PositionerName
)

Input parameters
SocketID int Socket identifier gets by the "TCP_ConnectToServer" function.
PositionerName char * Positioner name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
- **-121**: Function is not allowed due to configuration disabled.
7.2.1.199 **PositionerCompensatedPCOPrepare** [Extended - ISA]

**Name**

**PositionerCompensatedPCOPrepare** – Prepares data for CIE08 compensated PCO pulses generation.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)
- Checks the positioner type: (-8)
- Checks the position encoder ("AquadB" or "AnalogInterpolated"): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini):
  ERR_NOT_ALLOWED_MODE_DISABLED (-121)
- Checks data have been set, loaded or read from file to buffer (DataNumber must > 0 and < CIE08CompensatedPCOMaximumDataNumber (system.ini)):
  ERR_CHECK_DATA_INCORRECT (-122)
- Checks scanning zone exceed stage travel limits: (-35)
- Checks input parameter values (ScanDirection value must equal to 1 (positive direction) or -1 (negative direction)): (-17)

**Description**

This function calculates the firing for absolute positions, in user’s coordinate system and converts them to firing absolute raw PCO positions, in encoder’s coordinate system.

When mappings are enabled, the correction between user’s coordinate system position and raw encoder position will be different at each location. For this reason, the prepare function must know the location (positions of all positioners in the scanning group) where the scan will be done.

This function must be called before the use of PositionerCompensatedPCOEnable() function.

**Parameters**:

- **ScanDirection**: Scan direction, (value: 1 (positive) or -1 (negative)).
- **StartPosition1**: Group 1\(^{st}\) positioner start position.
- **StartPosition2**: Group 2\(^{nd}\) positioner start position
- **StartPosition3**: Group 3\(^{rd}\) positioner start position
- ...... etc ......

**NOTE**

The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini: CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder ("AquadB" or "AnalogInterpolated"), otherwise (-24) error is returned.
Prototype

```c
int PositionerCompensatedPCOPrepare(
    int SocketID,
    char * PositionerName
    int ScanDirection,
    double StartPosition1,
    double StartPosition2,
    double StartPosition3,
    ...
)
```

Input parameters

**SocketID**  
int  
Socket identifier gets by the “TCP_ConnectToServer” function.

**PositionerName**  
char *  
Positioner name.

**ScanDirection**  
int  
Scan direction (1 or -1).

**StartPosition1**  
double  
Group 1st positioner start position (units).

**StartPosition2**  
double  
Group 2nd positioner start position (units).

**StartPosition3**  
double  
Group 3rd positioner start position (units).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.

- **-8:**  
  Wrong object type for this command.

- **-17:**  
  Parameter out of range or incorrect

- **-18:**  
  Positioner Name doesn't exist or unknown command.

- **-24:**  
  Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).

- **-35:**  
  Position is outside of travel limits.

- **-115:**  
  Function is not supported by current hardware.

- **-121:**  
  Function is not allowed due to configuration disabled.

- **-122:**  
  Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.200 PositionerCompensatedPCOSet [Extended - ISA]

**Name**
PositionerCompensatedPCOSet – Calculates a set of evenly spaced firing positions to the controller memory.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Start < Stop, Distance > 0, Width > 0, Width < Distance, Width < Stop - Start: (-17)
- Checks the positioner name: (-18)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the CIE board supports this function: (-115)
- Checks CIE08CompensatedPCOMode = Enabled (system.ini): (-121)
- Checks data number NData = integer((Stop-Start)/Distance) + 1, if NData >1000000: (-122)

**Description**
This function calculates a set of evenly spaced firing positions to the controller memory.

**Parameters** :
- Start: Relative distance to the start position where PCO pulses start.
- Stop: Relative distance to the start position where PCO pulses stop.
- Distance: Step of pulses (distance between two consecutive pulses)
- Width: Width of the pulse enable signal at the firing positions.

**Example**: Send PositionerCompensatedPCOSet (XY.X, 0, 3, 1, 0.1)

---

**NOTE**
Start and Stop are the offset values relative to the scanning positioner start position that is defined in the PositionerCompensatedPCOPrepare().

The function works only when the CIE08 compensated PCO mode configuration is enabled (system.ini; CIE08CompensatedPCOMode = Enabled).

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”), otherwise (-24) error is returned.

**Prototype**
int PositionerCompensatedPCOSet (int SocketID, char PositionerName[250] , double Start, double Stop, double Distance, double Width)

**Input parameters**
- **SocketID** int  
  Socket identifier gets by the “TCP_ConnectToServer” function
- **PositionerName** char *  
  Positioner name
- **Start** double  
  Start position (units)
- **Stop** double  
  Stop position (units)
- **Distance** double  
  Distance between two consecutive pulses (units)
- **Width** double  
  Width of pulse enable signal (units)
Output parameter
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner name doesn't exist or unknown command.
- -24: Incorrect file name, bad section name, or not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware
- -121: Function is not allowed due to configuration disabled.
- -122: Data incorrect (wrong value, wrong format, wrong order or inexistent).
7.2.1.201 PositionerCompensationDisturbanceDisable

[Extended]

Name
PositionerCompensationDisturbanceDisable – Disables disturbance compensation for selected direction (DisabledDirection = Both, Positive or Negative)

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)

Description
This function disables the compensation of disturbance for the selected direction (Both, Positive or Negative).

Prototype
int PositionerCompensationDisturbanceDisable (int SocketID, char *PositionerName, char *DisabledDirection)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
DisabledDirection char* “Both”, “Positive” or “Negative”

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.202 PositionerCompensationDisturbanceEnable
[Extended]

**Name**
PositionerCompensationDisturbanceEnable– Enables disturbance compensation for selected direction (EnabledDirection = Both, Positive or Negative)

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: -17
- Checks if a disturbance compensation file is loaded: -22

**Description**
This function enables the compensation of disturbance for the selected direction (Both, Positive or Negative). The disturbance compensation can be enabled only if a file was loaded (refer to API PositionerCompensationDisturbanceFileLoad).

**Prototype**

```c
int PositionerCompensationDisturbanceEnable(
    int SocketID,
    char *PositionerName,
    char *EnabledDirection
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.
- **EnabledDirection** char* “Both”, “Positive” or “Negative”

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action
7.2.1.203 **PositionerCompensationDisturbanceFileLoad**  
**[Extended]**

**Name**

`PositionerCompensationDisturbanceFileLoad` – Loads file to compensate disturbance in requested direction (Positive or Negative).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)
- Checks if the disturbance compensation feature is allowed in the firmware: -205
- Checks if the disturbance compensation is enabled in the requested direction: -22

**Description**

This function loads a file that contains the compensation of disturbance in one direction. The file cannot be loaded if the disturbance compensation in the requested direction is already enabled. In this case, it can be disabled with the `PositionerCompensationDisturbanceDisable` API.

**Prototype**

```
int PositionerCompensationDisturbanceFileLoad(  
    int SocketID,  
    char *PositionerName,  
    char *Direction,  
    char *FileName  
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.
- `PositionerName` char*: Positioner name.
- `Direction` char*: “Positive” or “Negative”.
- `FileName` char*: File name located in `\Config` folder.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action
- -61: Error file corrupt or file doesn’t exist
- -205: Not enable in your configuration
7.2.1.204 PositionerCompensationDisturbanceStatusGet
[Extended]

Name
PositionerCompensationDisturbanceStatusGet – Gets status of disturbance compensation in both directions.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the filter number: (-17)

Description
This function returns the “Enabled” status of the disturbance compensation in both positive and negative directions.

Prototype
int PositionerCompensationDisturbanceStatusGet(
    int SocketID,
    char *PositionerName,
    char * PositiveCompensationEnabledStatus,
    char * NegativeCompensationEnabledStatus
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
PositiveCompensationEnabledStatus char * Current “Enabled” status in the positive direction
NegativeCompensationEnabledStatus char * Current “Enabled” status in the negative direction

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.205 **PositionerCompensationDualLoopNotchFilterGet**

**[Extended]**

**Name**

*PositionerCompensationDualLoopNotchFilterGet* – Gets the notch filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the notch filter number: (-17)
- Checks the positioner name: (-18)
- Checks dual corrector is enabled: (-205)

**Description**

This function returns the parameters defined for the selected notch filter in dual loop.

Notch filters parameters:
- NotchFrequency.
- NotchBandwidth.
- NotchGain.

**Prototype**

```c
int PositionerCompensationDualLoopNotchFilterGet(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,
    double * NotchFrequency,
    double * NotchBandwith,
    double * NotchGain
);
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - char *
  - Positioner name.
- **NotchFrequencyNumber**
  - int
  - Number of the selected Notch Frequency filter.

**Output parameters**

- **NotchFrequency**
  - double *
  - Frequency (Hertz) for notch filter.
- **NotchBandwith**
  - double *
  - Band width (Hertz) for notch filter.
- **NotchGain**
  - double *
  - Gain for notch filter.
**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -205: Not enabled in your configuration.
7.2.1.206 **PositionerCompensationDualLoopNotchFilterSet**

**[Extended]**

**Name**

*PositionerCompensationDualLoopNotchFilterSet* – Sets the notch mode filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  
  - NotchFrequency with CorrectorPeriod = 0.0001 s (10 kHz) = > [0 : 5000]
  
  - NotchBandwidth with CorrectorPeriod = 0.0001 s (10 kHz) = > [0 : 5000]
  
  - NotchGain [0 : 100]
- Checks the positioner name: (-18)

**Description**

This function configures the parameters defined for selected notch filter in dual loop. If the “NotchFrequency” value is NULL or the “NotchGain” value is NULL then the notch filter is not activated.

Notch filters parameters:

- NotchFrequency.
- NotchBandwidth.
- NotchGain.

**Prototype**

```c
int PositionerCompensationDualLoopNotchFilterSet(  
    int SocketID,  
    char * PositionerName,  
    int NotchFrequencyNumber,  
    double NotchFrequency,  
    double NotchBandwidth,  
    double NotchGain  
)
```

**Input parameters**

- **SocketID** `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** `char *` Positioner name.
- **NotchFrequencyNumber** `int` Number of the selected Notch Frequency filter.
- **NotchFrequency** `double` Frequency (Hertz) for notch filter.
- **NotchBandwidth** `double` Band width (Hertz) for notch filter.
- **NotchGain** `double` Gain for notch filter.
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.207 **PositionerCompensationDualLoopPhaseCorrectionFilterGet [Extended]**

**Name**

`PositionerCompensationDualLoopPhaseCorrectionFilterGet` – Gets the phase correction filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the notch filter number: (-17)
- Checks the positioner name: (-18)
- Checks dual corrector is enabled: (-205)

**Description**

This function returns the system compensation parameters defined for selected phase correction filter in dual loop.

Phase correction filter parameters:

- `PhaseCorrectionFn`.
- `PhaseCorrectionFd`.
- `PhaseCorrectionGain`.

**Prototype**

```c
int PositionerCompensationDualLoopPhaseCorrectionFilterGet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double * PhaseCorrectionFn,
    double * PhaseCorrectionFd,
    double * PhaseCorrectionGain
)
```

**Input parameters**

- **SocketID**
  - `int`
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - `char *`
  - Positioner name.
- **PhaseCorrectionFilterNumber**
  - `int`
  - Number of the selected selected phase correction filter.

**Output parameters**

- **PhaseCorrectionFn**
  - `double *`
  - Numerator frequency (Hertz) for phase correction filter.
- **PhaseCorrectionFd**
  - `double *`
  - Denominator frequency (Hertz) for phase correction filter.
- **PhaseCorrectionGain**
  - `double *`
  - Gain for phase correction filter.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -205: Not enabled in your configuration.
7.2.1.208 **PositionerCompensationDualLoopPhaseCorrectionFilterSet** [Extended]

**Name**

PositionerCompensationDualLoopPhaseCorrectionFilterSet – Sets the notch mode filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - PhaseCorrectionFn with CorrectorPeriod = 0.0001 s (10 kHz) = > \([0 : 5000]\)
  - PhaseCorrectionFd with CorrectorPeriod = 0.0001 s (10 kHz) = > \([0 : 5000]\)
  - PhaseCorrectionGain ≥0
- Checks the positioner name: (-18)

**Description**

This function configures the parameters defined for the selected phase correction filter in dual loop. If the “PhaseCorrectionFn” value = 0 or the “PhaseCorrectionFd” value = 0 then the phase correction filter is not activated.

Phase correction filter parameters:

- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

**Prototype**

```c
int PositionerCompensationDualLoopNotchFilterSet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double PhaseCorrectionFn,
    double PhaseCorrectionFd,
    double PhaseCorrectionGain
)
```

Return (In addition to the results of "Input Tests Common to all XPS Functions")

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.211 PositionerCompensationEncoderNotchFilterGet

[Extended]

Name
PositionerCompensationEncoderNotchFilterGet – Gets Encoder compensation notch filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks parameter values: (-17)
- Notch Frequency number  \([1:5]\)

Description
This function returns parameters defined for the `/Dual/EncoderFilter` frequency notch filter from the encoder compensation (F4 compensation block) configured in encoder.

Encoder Mapping
- Raw Encoder Position
- Corrected Encoder Position
- Filtered Corrected Encoder Position

Encoder Notch filters parameters:
- NotchFrequency (Hertz).
- NotchBandwidth (Hertz).
- NotchGain.

Prototype
```c
int PositionerCompensationEncoderNotchFilterGet(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,
    double * NotchFrequency,
    double * NotchBandwith,
    double * NotchGain
)
```

Input parameters
- `SocketID` int: Socket identifier gets by the TCP_ConnectToServer™ function.
- `PositionerName` char *: Positioner name.
- `NotchFrequencyNumber` int: Number of the selected Notch Frequency filter (1 to 5).

Output parameters
- `NotchFrequency` double *: Frequency (Hertz) for Encoder Notch filter.
- `NotchBandwith` double *: Bandwidth (Hertz) for Encoder Notch filter.
- `NotchGain` double *: Gain for Encoder Notch filter.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
7.2.1.212 **PositionerCompensationEncoderNotchFilterSet**

[Extended]

**Name**

**PositionerCompensationEncoderNotchFilterSet** – Sets Encoder compensation notch filters parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks parameter values: (-17)
  - Notch Frequency number \[1:5\]
  - NotchFrequency \[0 : \frac{0.5}{\text{CorrectorPeriod}}\] with CorrectorPeriod = 0.0001 s  
    \[(10\ kHz) \Rightarrow [0 : 5000]\]
  - NotchBandwidth \[0 : \frac{0.5}{\text{CorrectorPeriod}}\] with CorrectorPeriod = 0.0001 s  
    \[(10\ kHz) \Rightarrow [0 : 5000]\]
  - NotchGain \[0:100]\n
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function sets the selected [Dual]EncoderFilter frequency notch filter parameters from the encoder compensation (F4 compensation block) configured in encoder.

Encoder Notch filters parameters:
- NotchFrequency (Hertz).
- NotchBandwidth (Hertz).
- NotchGain.

**Prototype**

```c
int PositionerCompensationEncoderNotchFilterSet(  
  int SocketID,  
  char * FullPositionerName,  
  int NotchFrequencyNumber,  
  double NotchFrequency,  
  double NotchBandwidth,  
  double NotchGain  
)
```
**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the "TCP_ConnectToServer" function.

- **FullPositionerName**: char *  
  Positioner name.

- **NotchFrequencyNumber**: int  
  Number of the selected Notch Frequency filter (1 to 5).

- **NotchFrequency**: double  
  Frequency (Hertz) for Encoder Notch filter.

- **NotchBandwidth**: double  
  Band width (Hertz) for Encoder Notch filter.

- **NotchGain**: double  
  Gain for Encoder Notch filter.

**Output parameters**

None.

**Return** (In addition to the results of "Input Tests Common to all XPS Functions")

- 0:  No error.
- -17:  Parameter out of range or incorrect.
- -117:  Function is only allowed in DISABLED state.
7.2.1.213 PositionerCompensationFrequencyNotchsGet

[Extended]

Name
PositionerCompensationFrequencyNotchsGet – Gets pre-feedforward compensation notch filters parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)
- CompensationFilterType = Default or XPS-Q

Description
This function returns the CompensationSystemPreFeedForward frequency notch filters parameters. These notch filters allow the user to reduce external perturbations such as base motion or floor vibrations. Note that the CompensationSystemPreFeedForward feature is available for all corrector types (acceleration, velocity, voltage or position) functioning in closed loop configuration.

- NotchFrequency1
- NotchsBandwidth1
- NotchsGain1
- NotchFrequency2
- NotchsBandwidth2
- NotchsGain2
- NotchFrequency3
- NotchsBandwidth3
- NotchsGain3

Prototype
int PositionerCompensationFrequencyNotchsGet(
    int SocketID,
    char * FullPositionerName,
    double * NotchFrequency1,
    double * NotchBandwidth1,
    double * NotchGain1,
    double * NotchFrequency2,
    double * NotchBandwidth2,
    double * NotchGain2,
    double * NotchFrequency3,
    double * NotchBandwidth3,
    double * NotchGain3
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.
Output parameters

- NotchFrequency1: double * Notch frequency for filter #1 (Hz).
- NotchBandwidth1: double * Notch bandwidth for filter #1 (Hz).
- NotchGain1: double * Notch gain for filter #1.
- NotchFrequency2: double * Notch frequency for filter #2 (Hz).
- NotchBandwidth2: double * Notch bandwidth for filter #2 (Hz).
- NotchGain2: double * Notch gain for filter #2.
- NotchFrequency3: double * Notch frequency for filter #3 (Hz).
- NotchBandwidth3: double * Notch bandwidth for filter #3 (Hz).
- NotchGain3: double * Notch gain for filter #3.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.214 **PositionerCompensationFrequencyNotchsSet**

**[Extended]**

**Name**

*PositionerCompensationFrequencyNotchsSet* – Sets pre-feedforward compensation notch filters parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: ERR_WRONG_OBJECT_TYPE (-8)
- Checks parameter values: ERR_PARAMETER_OUT_OF_RANGE (-17)
  
  - NotchFrequency 0 : $\frac{0.5}{\text{CorrectorISRPeriod}}$
  - NotchBandwidth 0 : $\frac{0.5}{\text{CorrectorISRPeriod}}$
- Checks the motion status (Motion status must be disable): (-117)

**NOTE**

Refer to *system.ref* file to get CorrectorISRPeriod value.

**Description**

This function sets the *CompensationSystemPreFeedForward* frequency notch filters parameters. These notch filters allow the user to reduce external perturbations such as base motion or floor vibrations. Note that the *CompensationSystemPreFeedForward* feature is available for all corrector types (acceleration, velocity, voltage or position) functioning in closed loop configuration.

- NotchFrequency1
- NotchBandwidth1
- NotchGain1
- NotchFrequency2
- NotchBandwidth2
- NotchGain2
- NotchFrequency3
- NotchBandwidth3
- NotchGain3
Prototype

```c
int PositionerCompensationFrequencyNotchSet(
    int SocketID,
    char * FullPositionerName,
    double NotchFrequency1,
    double NotchBandwidth1,
    double NotchGain1,
    double NotchFrequency2,
    double NotchBandwidth2,
    double NotchGain2,
    double NotchFrequency3,
    double NotchBandwidth3,
    double NotchGain3
)
```

Input parameters

- **SocketID**
  int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  char * Positioner name.
- **NotchFrequency1**
  double Notch frequency for filter #1 (Hz).
- **NotchBandwidth1**
  double Notch bandwidth for filter #1 (Hz).
- **NotchGain1**
  double Notch gain for filter #1.
- **NotchFrequency2**
  double Notch frequency for filter #2 (Hz).
- **NotchBandwidth2**
  double Notch bandwidth for filter #2 (Hz).
- **NotchGain2**
  double Notch gain for filter #2.
- **NotchFrequency3**
  double Notch frequency for filter #3 (Hz).
- **NotchBandwidth3**
  double Notch bandwidth for filter #3 (Hz).
- **NotchGain3**
  double Notch gain for filter #3.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -117: Function is only allowed in DISABLED state.
7.2.1.215 **PositionerCompensationLowPassTwoFilterGet**

[Extended]

**Name**

*PositionerCompensationLowPassTwoFilterGet* – Gets the post-feedforward compensation second order low-pass filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)

**Description**

This function returns the system compensation parameters defined for the post-feedforward compensation second order low-pass filter.

**Prototype**

```c
int PositionerCompensationLowPassTwoFilterGet(
    int SocketID,
    char * FullPositionerName,
    double * CutOffFrequency
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char*: Positioner name.

**Output parameters**

- **CutOffFrequency** double*: Second order filter cut-off frequency (Hertz).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.216 PositionerCompensationLowPassTwoFilterSet
[Extended]

**Name**

PositionerCompensationLowPassTwoFilterSet – Sets the post-feedforward compensation second order low-pass filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)
- Checks parameter values: (-17)
  
  - CutOffFrequency 0 : \[
  \text{CorrectorISRPeriod} = 0.5
  \]

```
NOTE
Refer to system.ref file to get CorrectorISRPeriod value.
```

**Description**

This function configures the parameters defined for the post-feedforward compensation second order low-pass filter.

```
NOTE
If the “CutOffFrequency” value = 0 then the second order low-pass filter is not activated.
```

**Prototype**

```
int PositionerCompensationLowPassTwoFilterSet(
    int SocketID,
    char * FullPositionerName,
    double CutOffFrequency
)
```

**Input parameters**

- SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
- FullPositionerName char * Positioner name.
- CutOffFrequency double Second order filter cut-off frequency (Hertz).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.217 PositionerCompensationNotchFilterGet [Extended]

Name
PositionerCompensationNotchFilterGet – Gets the notch filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks phase correction number: (-17)
- Checks the positioner name: (-18)

Description
This function returns the parameters defined for the selected notch filter.
Notch filters parameters:
- NotchFrequency.
- NotchBandwidth.
- NotchGain.

Prototype
int PositionerCompensationNotchFilterGet(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,
    double * NotchFrequency,
    double * NotchBandwith,
    double * NotchGain)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
NotchFrequencyNumber int Number of the selected Notch Frequency filter.

Output parameters
NotchFrequency double * Frequency (Hertz) for notch filter.
NotchBandwith double * Band width (Hertz) for notch filter.
NotchGain double * Gain for notch filter.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -205: Not enable in your configuration.
### 7.2.1.218 `PositionerCompensationNotchFilterSet` [Extended]

#### Name
`PositionerCompensationNotchFilterSet` – Sets the notch filter parameters.

#### Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - `NotchFrequency ∈ [0 : \frac{0.5}{\text{CorrectorPeriod}}]`
  - `NotchBandwidth ∈ [0 : \frac{0.5}{\text{CorrectorPeriod}}]`
  - `NotchGain \ [0 : 100]`
- Checks the positioner name: (-18)
- Checks compensation preFeed forward mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

#### Description
This function configures the parameters defined for the selected notch filter. If the “NotchFrequency” value is NULL or the “NotchGain” value is NULL then the notch filter is not activated.

Notch filter parameters:
- `NotchFrequency`.
- `NotchBandwidth`.
- `NotchGain`.

#### Prototype
```c
int PositionerCompensationNotchFilterSet(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,  
    double NotchFrequency,
    double NotchBandwith,
    double NotchGain
)
```
**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerName**  
  char *  
  Positioner name.

- **NotchFrequencyNumber**  
  int  
  Number of the selected phase correction filter.

- **NotchFrequency**  
  double  
  Frequency (Hertz) for notch filter.

- **NotchBandwidth**  
  double  
  Bandwidth (Hertz) for notch filter.

- **NotchGain**  
  double  
  Gain for notch filter.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.

- **0:**  
  No error.

- **-8:**  
  Wrong object type for this command.

- **-17:**  
  Parameter out of range or incorrect.

- **-18:**  
  Positioner Name doesn’t exist or unknown command.

- **-117:**  
  Function is only allowed in DISABLED state.

- **-205:**  
  Not enabled in your configuration.
7.2.1.219 **PositionerCompensationNotchModeFiltersGet**

**[Extended]**

**Name**

*PositionerCompensationNotchModeFiltersGet* – Gets the post-feedforward compensation notch mode filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)

**Description**

This function returns the system compensation parameters defined for two post-feedforward compensation notch mode filters.

First notch mode filter parameters:

- NotchModeFr1.
- NotchModeFa1.
- NotchModeZr1.
- NotchModeZa1.

Second notch mode filter parameters:

- NotchModeFr2.
- NotchModeFa2.
- NotchModeZr2.
- NotchModeZa2.

**Prototype**

```c
int PositionerCompensationNotchModeFiltersGet(
    int SocketID,
    char * FullPositionerName,
    double * NotchModeFr1,
    double * NotchModeFa1,
    double * NotchModeZr1,
    double * NotchModeZa1,
    double * NotchModeFr2,
    double * NotchModeFa2,
    double * NotchModeZr2,
    double * NotchModeZa2
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
</tbody>
</table>

Output parameters

- **NotchModeFr1**: double * Resonance frequency (Hertz) for notch mode filter #1.
- **NotchModeFa1**: double * Anti-resonance frequency (Hertz) for notch mode filter #1.
- **NotchModeZr1**: double * Resonance damping factor for notch mode filter #1.
- **NotchModeZa1**: double * Anti-resonance damping factor for notch mode filter #1.
- **NotchModeFr2**: double * Resonance frequency (Hertz) for notch mode filter #2.
- **NotchModeFa2**: double * Anti-resonance frequency (Hertz) for notch mode filter #2.
- **NotchModeZr2**: double * Resonance damping factor for notch filter #2.
- **NotchModeZa2**: double * Anti-resonance damping factor for notch mode filter #2.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
7.2.1.220 **PositionerCompensationNotchModeFiltersSet**

**[Extended]**

**Name**

*PositionerCompensationNotchModeFiltersSet* – Sets the post-feedforward compensation notch mode filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)
- Checks parameter values: (-17)
  
  - NotchModeFr 0: \[rac{0.5}{\text{CorrectorISRPeriod}}\]
  
  - NotchModeFa 0: \[rac{0.5}{\text{CorrectorISRPeriod}}\]

- Checks the motion status (Motion status must be disable): (-117)

**NOTE**

Refer to *system.ref* file to get CorrectorISRPeriod value.

**Description**

This function configures the parameters defined for two post-feedforward compensation notch mode filters.

First notch mode filter parameters:

- NotchModeFr1.
- NotchModeFa1.
- NotchModeZr1.
- NotchModeZa1.

Second notch mode filter parameters:

- NotchModeFr2.
- NotchModeFa2.
- NotchModeZr2.
- NotchModeZa2.

**NOTE**

If the “NotchModeFr” value = 0 or the “NotchModeFa” value = 0, then the notch mode filter is not activated.
Prototype

```c
int PositionerCompensationNotchModeFiltersSet(
    int SocketID,
    char * FullPositionerName,
    double NotchModeFr1,
    double NotchModeFa1,
    double NotchModeZr1,
    double NotchModeZa1,
    double NotchModeFr2,
    double NotchModeFa2,
    double NotchModeZr2,
    double NotchModeZa2
)
```

Input parameters

- **SocketID** | int | Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** | char * | Positioner name.
- **NotchModeFr1** | double | Resonance frequency (Hertz) for notch mode filter #1.
- **NotchModeFa1** | double | Anti-resonance frequency (Hertz) for notch mode filter #1.
- **NotchModeZr1** | double | Resonance damping factor for notch mode filter #1.
- **NotchModeZa1** | double | Anti-resonance damping factor for notch mode filter #1.
- **NotchModeFr2** | double | Resonance frequency (Hertz) for notch mode filter #2.
- **NotchModeFa2** | double | Anti-resonance frequency (Hertz) for notch mode filter #2.
- **NotchModeZr2** | double | Resonance damping factor for notch mode filter #2.
- **NotchModeZa2** | double | Anti-resonance damping factor for notch mode filter #2.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-117**: Function is only allowed in DISABLED state.
7.2.1.221 PositionerCompensationPhaseCorrectionFilterGet

[Extended]

Name
PositionerCompensationPhaseCorrectionFilterGet – Gets the phase correction filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks phase correction number: (-17)
- Checks the positioner name: (-18)

Description
This function returns the system compensation parameters defined for selected phase correction filter.

Phase correction filter parameters:
- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

Prototype
int PositionerCompensationPhaseCorrectionFilterGet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double * PhaseCorrectionFn,
    double * PhaseCorrectionFd,
    double * PhaseCorrectionGain
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PhaseCorrectionFilterNumber int Number of the selected Notch Frequency filter.

Output parameters
PhaseCorrectionFn double * Frequency (Hertz) for notch filter.
PhaseCorrectionFd double * Bandwidth (Hertz) for notch filter.
PhaseCorrectionGain double * Gain for notch filter.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -15: Wrong parameter type in the command string: int, short, int * or short * expected.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.222 PositionerCompensationPhaseCorrectionFilterSet

[Extended]

Name

PositionerCompensationPhaseCorrectionFilterSet – Sets the notch filter parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  
  - PhaseCorrectionFn ∈ \left[ 0 : \frac{0.5}{\text{CorrectorPeriod}} \right]
  
  - PhaseCorrectionFd ∈ \left[ 0 : \frac{0.5}{\text{CorrectorPeriod}} \right]

- Checks the positioner name: (-18)
- Checks the motion status (Motion status must be disable): (-117)

Description

This function configures the parameters defined for the selected phase correction filter. If the “PhaseCorrectionFn” value = 0 or the “PhaseCorrectionFd” value = 0 then the phase correction filter is not activated.

Phase correction filter parameters:

- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

Prototype

```c
int PositionerCompensationPhaseCorrectionFilterSet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double PhaseCorrectionFn,
    double PhaseCorrectionFd,
    double PhaseCorrectionGain
)
```

Input parameters

<table>
<thead>
<tr>
<th>SocketID</th>
<th>int</th>
<th>Socket identifier gets by the “TCP_ConnectToServer” function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
<tr>
<td>PhaseCorrectionFilterNumber</td>
<td>int</td>
<td>Number of the selected Notch Frequency filter.</td>
</tr>
<tr>
<td>PhaseCorrectionFn</td>
<td>double</td>
<td>Frequency (Hertz) for notch filter.</td>
</tr>
<tr>
<td>PhaseCorrectionFd</td>
<td>double</td>
<td>Band width (Hertz) for notch filter.</td>
</tr>
</tbody>
</table>
PhaseCorrectionGain      double      Gain for notch filter.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-117:** Function is only allowed in DISABLED state.
- **-205:** Not enabled in your configuration.
7.2.1.223 **PositionerCompensationPhaseCorrectionFiltersGet**

[Extended]

**Name**

*PositionerCompensationPhaseCorrectionFiltersGet* – Gets the post-feedforward compensation phase correction filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)

**Description**

This function returns the system compensation parameters defined for two post-feedforward compensation phase correction filters.

First phase correction filter parameters:

- PhaseCorrectionFn1.
- PhaseCorrectionFd1.
- PhaseCorrectionGain1.

Second phase correction filter parameters:

- PhaseCorrectionFn2.
- PhaseCorrectionFd2.
- PhaseCorrectionGain2.

**Prototype**

```c
int PositionerCompensationPhaseCorrectionFiltersGet(
    int SocketID,
    char * FullPositionerName,
    double * PhaseCorrectionFn1,
    double * PhaseCorrectionFd1,
    double * PhaseCorrectionGain1,
    double * PhaseCorrectionFn2,
    double * PhaseCorrectionFd2,
    double * PhaseCorrectionGain2
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>SocketID</th>
<th>int</th>
<th>Socket identifier gets by the “TCP_ConnectToServer” function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
</tbody>
</table>
Output parameters

PhaseCorrectionFn1 double * Numerator frequency (Hertz) for phase correction filter #1.
PhaseCorrectionFd1 double * Denominator frequency (Hertz) for phase correction filter #1.
PhaseCorrectionGain1 double * Gain for phase correction filter #1.
PhaseCorrectionFn2 double * Numerator frequency (Hertz) for phase correction filter #2.
PhaseCorrectionFd2 double * Denominator frequency (Hertz) for phase correction filter #2.
PhaseCorrectionGain2 double * Gain for phase correction filter #2.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.224 PositionerCompensationPhaseCorrectionFiltersSet

[Extended]

Name

PositionerCompensationPhaseCorrectionFiltersSet – Sets the post-feedforward compensation phase correction filter parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)
- Checks parameter values: (-17)
  - \( \text{PhaseCorrectionFn} \in \left[ 0 : \frac{0.5}{\text{CorrectorPeriod}} \right] \)
  - \( \text{PhaseCorrectionFd} \in \left[ 0 : \frac{0.5}{\text{CorrectorPeriod}} \right] \)
- Checks the motion status (Motion status must be disable): (-117)

NOTE

Refer to system.ref file to get CorrectorISRPeriod value.

Description

This functions configures the parameters defined for two post-feedforward compensation phase correction filters.

First phase correction filter parameters:
  - PhaseCorrectionFn1.
  - PhaseCorrectionFd1.
  - PhaseCorrectionGain1.

Second phase correction filter parameters:
  - PhaseCorrectionFn2.
  - PhaseCorrectionFd2.
  - PhaseCorrectionGain2.

NOTE

If the “PhaseCorrectionFn” value = 0 or the “PhaseCorrectionFd” value = 0 then the phase correction filter is not activated.
Prototype

```c
int PositionerCompensationPhaseCorrectionFiltersSet(
    int SocketID,
    char * FullPositionerName,
    double PhaseCorrectionFn1,
    double PhaseCorrectionFd1,
    double PhaseCorrectionGain1,
    double PhaseCorrectionFn2,
    double PhaseCorrectionFd2,
    double PhaseCorrectionGain2
)
```

Input parameters

- **SocketID** int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char *
  - Positioner name.
- **PhaseCorrectionFn1** double
  - Numerator frequency (Hertz) for phase correction filter #1.
- **PhaseCorrectionFd1** double
  - Denominator frequency (Hertz) for phase correction filter #1.
- **PhaseCorrectionGain1** double
  - Gain for phase correction filter #1.
- **PhaseCorrectionFn2** double
  - Numerator frequency (Hertz) for phase correction filter #2.
- **PhaseCorrectionFd2** double
  - Denominator frequency (Hertz) for phase correction filter #2.
- **PhaseCorrectionGain2** double
  - Gain for phase correction filter #2.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -117: Function is only allowed in DISABLED state.
7.2.1.225 PositionerCompensationPositionFilterGet

[Extended]

Name
PositionerCompensationPositionFilterGet – Gets the Position filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)

Description
This function returns the parameters defined for the selected position filter.
Position filters parameters:
- Frequency.
- DampingFactor.

Prototype
int PositionerCompensationPositionFilterGet(
    int SocketID,
    char * PositionerName,
    int PositionFilterNumber,
    double * Frequency,
    double * DampingFactor
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PositionFilterNumber int Number of the selected Position. Frequency filter.

Output parameters
Frequency double * Frequency (Hertz) for notch filter.
DampingFactor double * Damping factor for Position filter.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.226 **PositionerCompensationPositionFilterSet**

**[Extended]**

**Name**

*PositionerCompensationPositionFilterSet*– Sets the Position filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function configures the parameters defined for selected Position filter. If the “Frequency” value is NULL then the Position filter is not activated.

Position filters parameters:
- Frequency.
- DampingFactor.

**Prototype**

```c
int PositionerCompensationPositionFilterSet(
    int SocketID,
    char * PositionerName,
    int PositionFilterNumber,
    double Frequency,
    double DampingFactor
)
```

**Input parameters**

- **SocketID** *int* Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** *char* Positioner name.
- **PositionFilterNumber** *int* Number of the selected Position. Frequency filter.
- **Frequency** *double* Frequency (Hertz) for notch filter.
- **DampingFactor** *double* Damping factor for Position filter.

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-117:** Function is only allowed in DISABLED state.
7.2.1.227 **PositionerCompensationPostExcitationFrequencyNotchFilterGet [Extended]**

**Name**

PositionerCompensationPostExcitationFrequencyNotchFilterGet – Gets Notch filter parameters from F3 compensation block.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Notch Frequency number (1 to 10): (-17)

**Description**

This function returns the parameters defined for the selected notch filter from the post excitation compensation (F3 compensation block) configured in the current corrector (Option0, Option1 or Option2).

Notch filters parameters:

- NotchFrequency (Hertz).
- NotchBandwidth (Hertz).
- NotchGain.

**Prototype**

```c
int PositionerCompensationPostExcitationFrequencyNotchFilterGet(  
    int SocketID,  
    char * PositionerName,  
    int NotchFrequencyNumber,  
    double * NotchFrequency,  
    double * NotchBandwidth,  
    double * NotchGain
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int Socket identifier gets by the TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>PositionerName</td>
<td>char * Positioner name.</td>
</tr>
<tr>
<td>NotchFrequencyNumber</td>
<td>int Number of the selected Notch Frequency filter (1 to 10).</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NotchFrequency</td>
<td>double * Frequency (Hertz) for notch filter.</td>
</tr>
<tr>
<td>NotchBandwidth</td>
<td>double * Band width (Hertz) for notch filter.</td>
</tr>
<tr>
<td>NotchGain</td>
<td>double * Gain for notch filter.</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
7.2.1.228 \texttt{PositionerCompensationPostExcitationFrequencyNotchFilterSet} [Extended]

**Name**

\texttt{PositionerCompensationPostExcitationFrequencyNotchFilterSet} – Sets Notch filter parameters from F3 compensation block.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Notch Frequency number (1 to 10): (-17)
- Checks parameter values: (-17)
  - NotchFrequency \( 0 : \frac{0.5}{\text{CorrectorPeriod}} \) with \( \text{CorrectorPeriod} = 0.0001 \) s
    \( (10 \text{ kHz}) = \geq [0 : 5000] \)
  - NotchBandwidth \( 0 : \frac{0.5}{\text{CorrectorPeriod}} \) with \( \text{CorrectorPeriod} = 0.0001 \) s
    \( (10 \text{ kHz}) = \geq [0 : 5000] \)
  - NotchGain \( [0:100] \)
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function configures the parameters defined for selected Notch filter from the post excitation compensation (F3 block) configured in the current corrector (Option0, Option1 or Option2).

If the “NotchFrequency” value is NULL or the “NotchGain” value is NULL then the notch filter is not activated.

Notch filter parameters:
- NotchFrequency (Hertz).
- NotchBandwidth (Hertz).
- NotchGain.

**Prototype**

```c
int \texttt{PositionerCompensationPostExcitationFrequencyNotchFilterSet}(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,
    double NotchFrequency,
    double NotchBandwidth,
    double NotchGain
)
```
**Input parameters**

- **SocketID** int  
  Socket identifier gets by the `TCP_ConnectToServer` function.

- **PositionerName** char *  
  Positioner name.

- **NotchFrequencyNumber** int  
  Number of the selected Notch Frequency filter (1 to 10).

- **NotchFrequency** double  
  Frequency (Hertz) for notch filter.

- **NotchBandwith** double  
  Band width (Hertz) for notch filter.

- **NotchGain** double  
  Gain for notch filter.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -117: Function is only allowed in DISABLED state.
7.2.1.229 `PositionerCompensationPostExcitationLowPassFilterGet` [Extended]

**Name**

`PositionerCompensationPostExcitationLowPassFilterGet` – *Gets* the phase correction filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the positioner name: (-18)

**Description**

This function returns the system compensation parameters defined for the second order low-pass filter.

**Prototype**

```c
int PositionerCompensationPostExcitationLowPassFilterGet(
    int SocketID,
    char * PositionerName,
    double * CutOffFrequency
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**

- **CutOffFrequency** double * Second order filter cut-off frequency (Hertz).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
7.2.1.230 \texttt{PositionerCompensationPostExcitationLowPassFilterSet} \texttt{[Extended]}

\textbf{Name}

\texttt{PositionerCompensationPostExcitationLowPassFilterSet} – Sets second order low-pass filter parameters.

\textbf{Input tests}

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - \texttt{CutOffFrequency} with \texttt{CorrectorPeriod} = 0.0001 s (10 kHz) = > [0 : 5000]
- Checks the positioner name: (-18)
- Checks compensation post excitation mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

\textbf{Description}

This function configures the parameters defined for the second order low-pass filter. If the \texttt{“CutOffFrequency”} value = 0 then the second order low-pass filter is not activated.

\textbf{Prototype}

\begin{verbatim}
int \texttt{PositionerCompensationPostExcitationLowPassFilterSet}( 
    int SocketID, 
    char * PositionerName, 
    double CutOffFrequency 
)
\end{verbatim}

\textbf{Input parameters}

- \texttt{SocketID} \hspace{2cm} \texttt{int} \hspace{2cm} Socket identifier gets by the \texttt{“TCP_ConnectToServer”} function.
- \texttt{PositionerName} \hspace{2cm} \texttt{char *} \hspace{2cm} Positioner name.
- \texttt{CutOffFrequency} \hspace{2cm} \texttt{double} \hspace{2cm} Second order filter cut-off frequency (Hertz).

\textbf{Output parameters}

None.

\textbf{Return} (In addition to the results of “\texttt{Input Tests Common to all XPS Functions}”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Not available in this configuration (check hardware or configuration).
- -117: Function is only allowed in DISABLED state.
7.2.1.231 PositionerCompensationPostExcitationNotchModeFilterGet [Extended]

Name
PositionerCompensationPostExcitationNotchModeFilterGet – Gets the notch mode filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks phase correction number: (-17)
- Checks the positioner name: (-18)

Description
This functions returns the system compensation parameters defined for two notch mode filters.

Notch mode filter parameters:
• NotchModeFr: Resonance frequency (Hertz)
• NotchModeFa: Anti-resonance frequency (Hertz)
• NotchModeZr: Resonance damping factor.
• NotchModeZa: Anti-resonance damping factor.

Prototype
int PositionerCompensationPostExcitationNotchModeFilterGet(
    int SocketID,
    char * PositionerName,
    int NotchModeNumber,
    double * NotchModeFr,
    double * NotchModeFa,
    double * NotchModeZr,
    double * NotchModeZa
)

Input parameters
SocketID      int          Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char *      Positioner name.
NotchModeNumber int         Number of the selected notch mode filter.

Output parameters
NotchModeFr   double *    Resonance frequency (Hertz) for notch mode filter.
NotchModeFa   double *    Anti-resonance frequency (Hertz) for notch mode filter.
NotchModeZr   double *    Resonance damping factor for notch mode filter.
NotchModeZa   double *    Anti-resonance damping factor for notch mode filter.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.232 \texttt{PositionerCompensationPostExcitationNotchModeFilterSet} \[\text{[Extended]}\]

**Name**

\texttt{PositionerCompensationPostExcitationNotchModeFilterSet} – Sets the notch mode filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - \texttt{NotchModeFr} with \texttt{CorrectorPeriod} = 0.0001 s (10 kHz) = \texttt{[0 : 5000]}
  - \texttt{NotchModeFa} with \texttt{CorrectorPeriod} = 0.0001 s (10 kHz) = \texttt{[0 : 5000]}
- Checks the positioner name: (-18)
- Checks compensation post excitation mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function returns the system compensation parameters defined for two notch mode filters.

Notch mode filter parameters:

- \texttt{NotchModeFr}: Resonance frequency (Hertz)
- \texttt{NotchModeFa}: Anti-resonance frequency (Hertz)
- \texttt{NotchModeZr}: Resonance damping factor.
- \texttt{NotchModeZa}: Anti-resonance damping factor.

**Prototype**

```c
int \texttt{PositionerCompensationPostExcitationNotchModeFilterSet}( 
    int SocketID, 
    char * PositionerName, 
    int NotchModeNumber, 
    double * NotchModeFr, 
    double * NotchModeFa, 
    double * NotchModeZr, 
    double * NotchModeZa 
)
```
**Input parameters**

- **SocketID**
  - **Type**: int
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerName**
  - **Type**: char *
  - Description: Positioner name.

- **NotchModeNumber**
  - **Type**: int
  - Description: Number of the selected notch mode filter.

- **NotchModeFr**
  - **Type**: double
  - Description: Resonance frequency (Hertz) for notch mode filter.

- **NotchModeFa**
  - **Type**: double
  - Description: Anti-resonance frequency (Hertz) for notch mode filter.

- **NotchModeZr**
  - **Type**: double
  - Description: Resonance damping factor for notch mode filter.

- **NotchModeZa**
  - **Type**: double
  - Description: Anti-resonance damping factor for notch mode filter.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-24**: Not available in this configuration (check hardware or configuration).
- **-117**: Function is only allowed in DISABLED state.
7.2.1.233 \texttt{PositionerCompensationPostExcitationPhaseCorrec\-tionFilterGet} \textit{[Extended]}

\textbf{Name}
\texttt{PositionerCompensationPostExcitationPhaseCorrectionFilterGet} – Gets the phase correction filter parameters.

\textbf{Input tests}
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the phase correction filter number: (-17)
- Checks the positioner name: (-18)

\textbf{Description}
This function returns the system compensation parameters defined for selected phase correction filter.

Phase correction filter parameters:
- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

\textbf{Prototype}

\begin{verbatim}
int PositionerCompensationPostExcitationPhaseCorrectionFilterGet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double * PhaseCorrectionFn,
    double * PhaseCorrectionFd,
    double * PhaseCorrectionGain
)
\end{verbatim}

\textbf{Input parameters}

\begin{itemize}
    \item \texttt{SocketID} int Socket identifier gets by the \texttt{“TCP_ConnectToServer”} function.
    \item \texttt{PositionerName} char * Positioner name.
    \item \texttt{PhaseCorrectionFilterNumber} int Number of the selected phase correction filter.
\end{itemize}

\textbf{Output parameters}

\begin{itemize}
    \item \texttt{PhaseCorrectionFn} double * Numerator frequency (Hertz).
    \item \texttt{PhaseCorrectionFd} double * Denominator frequency (Hertz).
    \item \texttt{PhaseCorrectionGain} double * Gain for phase correction filter.
\end{itemize}
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.234 **PositionerCompensationPostExcitationPhaseCorrectionFilterSet** [Extended]

**Name**

*PositionerCompensationPostExcitationPhaseCorrectionFilterSet* – Sets the phase correction filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  
  - PhaseCorrectionFn $\in \left[0: \frac{0.5}{\text{CorrectorPeriod}}\right]
  
  - PhaseCorrectionFd $\in \left[0: \frac{0.5}{\text{CorrectorPeriod}}\right]
  
  - PhaseCorrectionGain $\geq 0$
- Checks the positioner name: (-18)
- Checks compensation post excitation mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function configures the parameters defined for the selected phase correction filter. If the “PhaseCorrectionFn” value = 0 or the “PhaseCorrectionFd” value = 0 then the phase correction filter is not activated.

Phase correction filter parameters:
- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

**Prototype**

```c
int PositionerCompensationPostExcitationPhaseCorrectionFilterSet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double * PhaseCorrectionFn,
    double * PhaseCorrectionFd,
    double * PhaseCorrectionGain
)
```
Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PhaseCorrectionFilterNumber int Number of the selected phase correction filter.
PhaseCorrectionFn double * Numerator frequency (Hertz) for phase correction filter.
PhaseCorrectionFd double * Denominator frequency (Hertz) for phase correction filter.
PhaseCorrectionGain double * Gain for phase correction filter.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Not available in this configuration (check hardware or configuration).
- -117: Function is only allowed in DISABLED state.
7.2.1.235 PositionerCompensationPreFeedForwardFrequencyNotchFilterGet [Extended]

Name

PositionerCompensationPreFeedForwardFrequencyNotchFilterGet – Gets the notch filter parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameter value: (-17)
- Checks the positioner name: (-18)

Description

This function returns the parameters defined for the selected notch filter.

Notch filters parameters:
- UserNotchFrequency.
- UserNotchBandwidth.
- UserNotchGain.

Prototype

int PositionerCompensationPreFeedForwardFrequencyNotchFilterGet(
    int SocketID,
    char * PositionerName,
    int NotchFrequencyNumber,
    double * NotchFrequency,
    double * NotchBandwith,
    double * NotchGain)

Input parameters

SocketAddress int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
NotchFrequencyNumber int Number of the selected Notch Frequency filter.

Output parameters

NotchFrequency double * Frequency (Hertz) for notch filter.
NotchBandwith double * Band width (Hertz) for notch filter.
NotchGain double * Gain for notch filter.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.236 PositionerCompensationPreFeedForwardFrequencyNotchFilterSet [Extended]

**Name**
PositionerCompensationPreFeedForwardFrequencyNotchFilterSet – Sets the notch filter parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - NotchFrequency with CorrectorPeriod = 0.0001 s (10 kHz) = >[0 : 5000] =
  - NotchBandwidth with CorrectorPeriod = 0.0001 s (10 kHz) = >[0 : 5000] =
  - NotchGain
- Checks the positioner name: (-18)
- Checks compensation preFeed forward mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

**Description**
This function configures the parameters defined for selected notch filter. If the “NotchFrequency” value is NULL or the “NotchGain” value is NULL then the notch filter is not activated.

Notch filters parameters:
- UserNotchFrequency.
- UserNotchBandwidth.
- UserNotchGain.

**Prototype**
```c
int PositionerCompensationPreFeedForwardFrequencyNotchFilterSet(  
    int SocketID,  
    char * PositionerName,  
    int NotchFrequencyNumber,  
    double NotchFrequency,  
    double NotchBandwith,  
    double NotchGain  
)
```

**Input parameters**
- **SocketID** int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char *
  - Positioner name.
- **NotchFrequencyNumber** int
  - Number of the selected Notch Frequency filter.
- **NotchFrequency** double
  - Frequency (Hertz) for notch filter.
- **NotchBandwith** double
  - Band width (Hertz) for notch filter.
- **NotchGain** double
  - Gain for notch filter.
Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Not available in this configuration (check hardware or configuration).
- -117: Function is only allowed in DISABLED state.
7.2.1.237 PositionerCompensationPreFeedForwardPhaseCorrectionFilterGet [Extended]

Name
PositionerCompensationPreFeedForwardPhaseCorrectionFilterGet – Gets the phase correction filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks phase correction number: (-17)
- Checks the positioner name: (-18)

Description
This function returns the system compensation parameters defined for selected phase correction filter.

Phase correction filter parameters:
• PhaseCorrectionFn.
• PhaseCorrectionFd.
• PhaseCorrectionGain.

Prototype
int PositionerCompensationPreFeedForwardPhaseCorrectionFilterGet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double * PhaseCorrectionFn,
    double * PhaseCorrectionFd,
    double * PhaseCorrectionGain
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PhaseCorrectionFilterNumber int Number of the selected phase correction filter.

Output parameters
PhaseCorrectionFn double * Numerator frequency (Hertz) for phase correction filter.
PhaseCorrectionFd double * Denominator frequency (Hertz) for phase correction filter.
PhaseCorrectionGain double * Gain for phase correction filter.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.238 *PositionerCompensationPreFeedForwardPhaseCorrectionFilterSet* [Extended]

**Name**

*PositionerCompensationPreFeedForwardPhaseCorrectionFilterSet* – Sets the phase correction filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters number: (-17)
  - PhaseCorrectionFn with CorrectorPeriod = 0.0001 s (10 kHz) = > [0 : 5000]
  - PhaseCorrectionFd with CorrectorPeriod = 0.0001 s (10 kHz) = > [0 : 5000]
  - PhaseCorrectionGain ≥0
- Checks the positioner name: (-18)
- Checks compensation preFeed forward mode is enabled: (-24)
- Checks the motion status (Motion status must be disable): (-117)

**Description**

This function configures the parameters defined for the selected phase correction filter. If the “PhaseCorrectionFn” value = 0 or the “PhaseCorrectionFd” value = 0 then the phase correction filter is not activated.

Phase correction filter parameters:
- PhaseCorrectionFn.
- PhaseCorrectionFd.
- PhaseCorrectionGain.

**Prototype**

```c
int PositionerCompensationPreFeedForwardPhaseCorrectionFilterSet(
    int SocketID,
    char * PositionerName,
    int PhaseCorrectionFilterNumber,
    double PhaseCorrectionFn,
    double PhaseCorrectionFd,
    double PhaseCorrectionGain
)
```
**Input parameters**

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-117:** Function is only allowed in DISABLED state.
7.2.1.239 `PositionerCompensationPreFeedForwardSpatialNotchFilterGet` [Extended]

**Name**

`PositionerCompensationPreFeedForwardSpatialNotchFilterGet` – Gets the spatial notch filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks spatial notch number: (-17)
- Checks the positioner name: (-18)

**Description**

This function returns the parameters defined for the selected spatial notch filter.

Spatial notch filters parameters:
- SpatialNotchStep.
- SpatialNotchBandwidth.
- SpatialNotchGain.

**Prototype**

```c
int PositionerCompensationPreFeedForwardSpatialNotchFilterGet(
    int SocketID,
    char * PositionerName,
    int SpatialNotchNumber,
    double * SpatialNotchStep,
    double * SpatialNotchBandwidth,
    double * SpatialNotchGain)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.
- **SpatialNotchNumber** int Number of the selected Spatial Notch Frequency filter.

**Output parameters**

- **SpatialNotchStep** double * Step for spatial notch filter.
- **SpatialNotchBandwidth** double * Band width (Hertz) for spatial notch filter.
- **SpatialNotchGain** double * Gain for spatial notch filter.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.240 **PositionerCompensationPreFeedForwardSpatialNotchFilterSet** [Extended]

**Name**

*PositionerCompensationPreFeedForwardSpatialNotchFilterSet* – Sets the notch filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - If (SpatialNotchStep > 1.0e-12)
    
    `| MaximumVelocity | SpatialNotchStep | CorrectorPeriod |
    |------------------|------------------|-----------------|
    | 0 : 0.5          | 0.5              | (CorrectorPeriod: see system.ref)

  - SpatialNotchBandwidth 0 : 0.5 CorrectorPeriod

  - SpatialNotchGain [0 : 100]
  
  - Else
  
    - SpatialNotchStep = 0
    
    - SpatialNotchBandwidth = 0
    
    - SpatialNotchGain = 1
  
  - Checks the positioner name: (-18)
  
  - Checks compensation preFeed forward mode is enabled: (-24)
  
  - Checks the motion status (Motion status must be disable): (-117)

**Description**

This function configures the parameters defined for selected spatial notch filter. If the “SpatialNotchStep” value is 0 then the spatial notch filter is not activated and the gain is setting to 1.

**Prototype**

```c
int PositionerCompensationPreFeedForwardSpatialNotchFilterSet(
    int SocketID,
    char * PositionerName,
    int SpatialNotchNumber,
    double SpatialNotchStep,
    double SpatialNotchBandwidth,
    double SpatialNotchGain
)
```
Input parameters

SocketID int  Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char *  Positioner name.
SpatialNotchStep double  Step for spatial notch filter.
SpatialNotchBandwidth double  Band width (Hertz) for spatial notch filter.
SpatialNotchGain double  Gain for spatial notch filter.
SpatialNotchNumber int  Number of the selected Spatial Notch Frequency filter.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -8:  Wrong object type for this command.
- -17:  Parameter out of range or incorrect.
- -18:  Positioner Name doesn't exist or unknown command.
- -24:  Not available in this configuration (check hardware or configuration).
- -117:  Function is only allowed in DISABLED state.
7.2.1.241 **PositionerCompensationSpatialPeriodicNotchsGet**

[Extended]

**Name**

*PositionerCompensationSpatialPeriodicNotchsGet* – Gets pre-feedforward compensation spatial periodic filters parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)

**Description**

This function returns the *CompensationSystemPreFeedForward* spatial periodic filters parameters. These filters reduce the spatial periodic perturbations coming from screw pitch or cogging.

Note that the *CompensationSystemPreFeedForward* feature is available for all corrector types (acceleration, velocity, voltage or position) functioning in closed loop configuration.

- SpatialNotchStep1.
- SpatialNotchsBandwidth1.
- SpatialNotchsGain1.
- SpatialNotchStep2.
- SpatialNotchsBandwidth2.
- SpatialNotchsGain2.
- SpatialNotchStep3.
- SpatialNotchsBandwidth3.
- SpatialNotchsGain3.

**Prototype**

```c
int PositionerCompensationSpatialPeriodicNotchsGet(
    int SocketID,
    char * FullPositionerName,
    double * SpatialNotchStep1,
    double * SpatialNotchsBandwidth1,
    double * SpatialNotchsGain1,
    double * SpatialNotchStep2,
    double * SpatialNotchsBandwidth2,
    double * SpatialNotchsGain2,
    double * SpatialNotchStep3,
    double * SpatialNotchsBandwidth3,
    double * SpatialNotchsGain3
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
### Output parameters

- **SpatialNotchStep1**: double * Spatial periodic step for filter #1 (units).
- **SpatialNotchBandwidth1**: double * Spatial periodic bandwidth for filter #1 (Hz).
- **SpatialNotchGain1**: double * Spatial periodic gain for filter #1.
- **SpatialNotchStep2**: double * Spatial periodic step for filter #2 (units).
- **SpatialNotchBandwidth2**: double * Spatial periodic bandwidth for filter #2 (Hz).
- **SpatialNotchGain2**: double * Spatial periodic gain for filter #2.
- **SpatialNotchStep3**: double * Spatial periodic step for filter #3 (units).
- **SpatialNotchBandwidth3**: double * Spatial periodic bandwidth for filter #3 (Hz).
- **SpatialNotchGain3**: double * Spatial periodic gain for filter #3.

### Return

(In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
7.2.1.242 PositionerCompensationSpatialPeriodicNotchsSet

[Extended]

Name
PositionerCompensationSpatialPeriodicNotchsSet – Sets pre-feedforward compensation spatial periodic filters parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks corrector type: (-8)
- Checks parameter values: (-17)
  • SpatialNotchStep \[ 0 \text{ MaximumVelocity} \ast \text{CorrectorISRPeriod} \]
  • SpatialNotchBandwidth \[ 0 : 0.5 \text{ CorrectorISRPeriod} \]
- Checks the motion status (Motion status must be disable): (-117)

NOTE
Refer to system.ref file to get CorrectorISRPeriod and stages.ini for MaximumVelocity values.

Description
This function sets the CompensationSystemPreFeedForward spatial periodic filters parameters. These filters reduce the spatial periodic perturbations coming from screw pitch or cogging.

Note that the CompensationSystemPreFeedForward feature is available for all corrector types (acceleration, velocity, voltage or position) functioning in closed loop configuration.

• SpatialNotchStep1.
• SpatialNotchBandwidth1.
• SpatialNotchGain1.
• SpatialNotchStep2.
• SpatialNotchBandwidth2.
• SpatialNotchGain2.
• SpatialNotchStep3.
• SpatialNotchBandwidth3.
• SpatialNotchGain3.
Prototype

```c
int PositionerCompensationSpatialPeriodicNotchesSet(
    int SocketID,
    char * FullPositionerName,
    double SpatialNotchStep1,  
    double SpatialNotchBandwidth1, 
    double SpatialNotchGain1,    
    double SpatialNotchStep2,  
    double SpatialNotchBandwidth2,  
    double SpatialNotchGain2,    
    double SpatialNotchStep3,  
    double SpatialNotchBandwidth3,  
    double SpatialNotchGain3
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **SpatialNotchStep1** double Spatial periodic step for filter #1 (units).
- **SpatialNotchBandwidth1** double Spatial periodic bandwidth for filter #1 (Hz).
- **SpatialNotchGain1** double Spatial periodic gain for filter #1.
- **SpatialNotchStep2** double Spatial periodic step for filter #2 (units).
- **SpatialNotchBandwidth2** double Spatial periodic bandwidth for filter #2 (Hz).
- **SpatialNotchGain2** double Spatial periodic gain for filter #2.
- **SpatialNotchStep3** double Spatial periodic step for filter #3 (units).
- **SpatialNotchBandwidth3** double Spatial periodic bandwidth for filter #3 (Hz).
- **SpatialNotchGain3** double Spatial periodic gain for filter #3.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -117: Function is only allowed in DISABLED state.
7.2.1.243 PositionerCorrectorAutoTuning

Name

PositionerCorrectorAutoTuning – Executes an auto-tuning process for determining position control loop PID values.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type: (-8)
- Positioner must not be a “Secondary Positioner”: (-8)
- Checks positioner name: (-18)
- Group status must be “READY”: (-22)
- Control loop type must be “PIDFFVelocity”, “PIDDualFFVoltage” or “PIDFFAcceleration”: (-24)

Description

The function executes an auto-tuning process and returns the calculated PID settings (KP, KI and KD values). The selected group must be in “READY” state, else (-22) error is returned.

This function works only if the positioner control loop type is “PIDFFVelocity” (velocity control), “PIDDualFFVoltage” (voltage control) or “PIDFFAcceleration” (acceleration control), else it returns (-24) error.

If the function is called when the positioner is not in READY state, (-22) error will be returned.

The “Mode” input value indicates the control mode of the position loop (Short Settle or High Robustness).

In the Short Settle mode, the PID values are adjusted to have high motion performance (short settling time, less following errors).

The High Robustness mode is used for a relatively good performance in motion, but guarantees the robustness (stability) for all stage situations (positions, velocities, accelerations).

If auto-tuning initialization fails (-104) error is returned, or if the motion becomes disabled then (-26) error is returned.

The auto-tuning process is executed in 5 periods. At the end of each period, the auto-tuning process estimates the auto-tuning quality by calculating the noise/signal ratio. If the noise/signal ratio is very close to zero (it means no oscillation), an (-101) error is returned. Else if the noise ratio >MaximumNoiseRatio (normally between 0.1 and 0.2, exact value defined in system.ref) then (-102) error is returned.

If the number of acquired data points (minimum = 9) or the number of acquired signal periods (minimum = 5) is not enough for a good estimate then (-103) error is returned.

At end of this function, the new PID setting is returned and the group status becomes “READY” once again.
Prototype

```c
int PositionerCorrectorAutoTuning(
    int SocketID,
    char * PositionerName,
    int Mode,
    double * KP,
    double * KI,
    double * KD
)
```

**Input parameters**

- **SocketID**
  - `int` Socket identifier gets by the "TCP_ConnectToServer" function.
- **PositionerName**
  - `char *` Positioner name.
- **Mode**
  - `int` Loop control mode (0 = short settle, or 1 = robust).

**Output parameters**

- **KP**
  - `double *` Calculated KP value.
- **KI**
  - `double *` Calculated KI value.
- **KD**
  - `double *` Calculated KD value.

**Return** (In addition to the results of "Input Tests Common to all XPS Functions")

- **0:** No error.
- **-5:** Not allowed due to a positioner error or hardware status.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-24:** Not available in this configuration (check hardware or configuration).
- **-101:** Relay Feedback Test failed: No oscillation.
- **-102:** Relay Feedback Test failed: Signal too noisy.
- **-103:** Relay Feedback Test failed: Signal data not enough for analyse.
- **-104:** Error of tuning process initialization.
7.2.1.244 PositionerCorrectorDamperFilterGet [Extended]

**Name**

PositionerCorrectorDamperFilterGet – Gets Dual control loop parameters for a selected positioner.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks damper filter is enabled: (-205)

**Description**

This function allows returning the Damper Filter parameters for a PID Acceleration control loop.

---

**NOTE**

The corrector must be “PIDFFAccelerationCorrector”.

---

**Prototype**

```c
int PositionerCorrectorDamperFilterGet(
    int SocketID,
    char * PositionerName,
    double * CutOffFrequency,
    double * DamperFactor,
    double * Gain
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**: char * Positioner name.

**Output parameters**

- **CutOffFrequency**: double * Damper filter cut-off frequency (Hz).
- **DamperFactor**: double * Damper factor (1 by default).
- **Gain**: double * Filter gain (0 or negative value).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-205**: Not enabled in your configuration.
7.2.1.245 PositionerCorrectorDamperFilterSet [Extended]

Name
PositionerCorrectorDamperFilterSet – Sets Dual control loop parameters for a selected positioner.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
- CutOffFrequency ≥0 and ≤(0.5 / ISRCorrectorPeriod)
- DamperFactor >0
- Gain ≤0
- Checks the motion status (Motion status must be disable): (-117)
- Checks damper filter is enabled: (-205)

Description
This function allows configuring the Damper Filter parameters for a PID Acceleration control loop.

NOTE
The main control loop must be “PIDFFAccelerationCorrector”.
This function is enabled only if the group state is DISABLE.

Prototype
int PositionerCorrectorDamperFilterSet(
    int SocketID,
    char * PositionerName,
    double CutOffFrequency,
    double DamperFactor,
    double Gain
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
CutOffFrequency double Damper filter cut-off frequency (Hz).
DamperFactor double Damper factor (1 by default).
Gain double Filter gain (0 or negative value).

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -117: Function is only allowed in DISABLED state.
- -205: Not enabled in your configuration.
**PositionerCorrectorDualGet [Extended]**

**Name**

`PositionerCorrectorDualGet` – Gets Dual control loop parameters for a selected positioner.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the positioner name: (-18)
- Checks dual corrector is enabled: (-205)

**Description**

This function allows returning the dual control loop parameter values.

**NOTE**

The “DualCorrectorMode” must be “Enabled” in the stages.ini file to activate the dual control loop. A secondary encoder has to be configured to be able to use the dual control loop. The main control loop must be “PIDFJAccelerationCorrector”.

**Prototype**

```c
int PositionerCorrectorDualGet(
    int SocketID,
    char * PositionerName,
    bool * ClosedLoopStatus,
    double * KP,
    double * KI,
    double * KD,
    double * IntegrationTime,
    double * DerivativeFilterCutOffFrequency,
    double * KFeedForwardAcceleration,
    double * KFeedForwardJerk
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char*: Positioner name.
### Output parameters

</table>

### Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-205:** Not enabled in your configuration.
7.2.1.246 PositionerCorrectorDualSet [Extended]

Name

PositionerCorrectorDualSet – Sets Dual control loop parameters for a selected positioner.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks input parameters value: (-17)
  - KP ≥0, KI ≥0, KD ≥0, KFeedForwardAcceleration ≥0, KFeedForwardJerk ≥0
  - IntegrationTime ≥CorrectorPeriod (0.0001 s)
- Checks the positioner name: (-18)

Description

This function allows returning the dual control loop parameter values.

NOTE

The “DualCorrectorMode” must be “Enabled” in the stages.ini file to activate the dual control loop. A secondary encoder has to be configured to be able to use the dual control loop. The main control loop must be “PIDFFAccelerationCorrector”.

Prototype

int PositionerCorrectorDualSet(
    int SocketID,
    char * PositionerName,
    bool ClosedLoopStatus,
    double KP,
    double KI,
    double KD,
    double IntegrationTime,
    double DerivativeFilterCutOffFrequency,
    double KFeedForwardAcceleration,
    double KFeedForwardJerk
)
**Input parameters**

- **SocketID** int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerName** char *
  - Positioner name.

- **ClosedLoopStatus** bool
  - Dual control loop status (true = closed and false = opened).

- **KP** double
  - PID servo loop proportional gain.

- **KI** double
  - PID servo loop integral gain.

- **KD** double
  - PID servo loop derivative gain.

- **IntegrationTime** double
  - PID integration time (seconds).

- **DerivativeFilterCutOffFrequency** double
  - PID derivative filter cut-off frequency (Hz).

- **KFeedForwardAcceleration** double
  - Acceleration feedforward gain (units).

- **KFeedForwardJerk** double
  - Jerk feedforward gain (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-18:** Positioner Name doesn't exist or unknown command.
7.2.1.247 **PositionerCorrectorExcitationSignalGainGet**

**Name**

`PositionerCorrectorExcitationSignalGainGet` – Gets corrector excitation signal gain.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)

**Description**

This function returns the corrector excitation signal gain for the selected positioner.

**Prototype**

```c
int PositionerCorrectorPIDBaseGet(int SocketID, char * PositionerName, double * ExcitationSignalGain)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char *: Positioner name.

**Output parameters**

- **ExcitationSignalGain** double *: Excitation signal gain.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-18**: Positioner Name doesn't exist or unknown command.
7.2.1.248 **PositionerCorrectorExcitationSignalGainSet**

**Name**

*PositionerCorrectorExcitationSignalGainSet* – Sets corrector excitation signal gain.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the parameter value: value must be between -1 and 1, else return “Parameter out of range or incorrect” (-17)
- Checks the positioner name: (-18)

**Description**

This function configures the corrector excitation signal gain for the selected positioner. ExcitationSignalGain value must ≥-1 and ≤1.

---

**NOTE**

The final gain of excitation signal for primary positioner = \( K_{FeedforwardExcitationToPrimary} \times \text{ExcitationSignalGain} \)

The final gain of excitation signal for secondary positioner = \( K_{FeedforwardExcitationToSecondary} \times \text{ExcitationSignalGain} \)

To have more details about \( K_{FeedforwardExcitationToPrimary} \) and \( K_{FeedforwardExcitationToSecondary} \), refer to the API *PositionerExcitationKFeedforwardSet()*

**Prototype**

```c
Int PositionerCorrectorExcitationSignalGainSet(
    int SocketID,
    char * PositionerName,
    double ExcitationSignalGain
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char *: Positioner name.
- **ExcitationSignalGain** double: Excitation signal gain.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.249 **PositionerCorrectorNotchFiltersGet [Extended]**

**Name**

*PositionerCorrectorNotchFiltersGet* – Gets the notch filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)

**Description**

This function returns the parameters defined for two notch filters.

First notch filter parameters:
- UserNotchFrequency1.
- UserNotchBandwidth1.
- UserNotchGain1.

Second notch filter parameters:
- UserNotchFrequency2.
- UserNotchBandwidth2.
- UserNotchGain2.

NOTE

If the corrector type is "NoEncoderPositionCorrector" then (-24) error is returned.

**Prototype**

```c
int PositionerCorrectorNotchFiltersGet(
    int SocketID,
    char * FullPositionerName,
    double * NotchFrequency1,
    double * NotchBandwidth1,
    double * NotchGain1,
    double * NotchFrequency2,
    double * NotchBandwidth2,
    double * NotchGain2
)
```

**Input parameters**

- **SocketID** 
  int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** 
  char *
  Positioner name.
**Output parameters**

- NotchFrequency1: double * Frequency (Hertz) for notch filter #1.
- NotchBandwith1: double * Band width (Hertz) for notch filter #1.
- NotchGain1: double * Gain for notch filter #1.
- NotchFrequency2: double * Frequency (Hertz) for notch filter #2.
- NotchBandwith2: double * Band width (Hertz) for notch filter #2.
- NotchGain2: double * Gain for notch filter #2.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -24: Not available in this configuration (check hardware or configuration).
### 7.2.1.250 PositionerCorrectorNotchFiltersSet [Extended]

#### Name

**PositionerCorrectorNotchFiltersSet** – Sets the notch filter parameters.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks parameter values: (-17)
  - NotchFrequency
  - NotchBandwidth
  - NotchGain  

#### Description

This function configures the parameters defined for two notch filters. If the “NotchFrequency” value is NULL or the “NotchGain” value is NULL then the notch filter is not activated.

First notch filter parameters:
- NotchFrequency1.
- NotchBandwidth1.
- NotchGain1.

Second notch filter parameters:
- NotchFrequency2.
- NotchBandwidth2.
- NotchGain2.

#### NOTE

Refer to `system.ref` file to get `CorrectorISRPeriod` value.

#### Description

If the corrector type is “NoEncoderPositionCorrector” then (-24) error is returned.
Prototype

```c
int PositionerCorrectorNotchFiltersSet(
    int SocketID,
    char * FullPositionerName,
    double NotchFrequency1,
    double NotchBandwith1,
    double NotchGain1,
    double NotchFrequency2,
    double NotchBandwith2,
    double NotchGain2
)
```

Input parameters

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**  
  char *  
  Positioner name.

- **NotchFrequency1**  
  double  
  Frequency (Hertz) for notch filter #1.

- **NotchBandwith1**  
  double  
  Band width (Hertz) for notch filter #1.

- **NotchGain1**  
  double  
  Gain for notch filter #1.

- **NotchFrequency2**  
  double  
  Frequency (Hertz) for notch filter #2.

- **NotchBandwith2**  
  double  
  Band width (Hertz) for notch filter #2.

- **NotchGain2**  
  double  
  Gain for notch filter #2.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  
  No error.

- -8:  
  Wrong object type for this command.

- -17:  
  Parameter out of range or incorrect.

- -24:  
  Not available in this configuration (check hardware or configuration).
7.2.1.251 PositionerCorrectorPIDAccelerationFilterGet

[Extended]

Name
PositionerCorrectorPIDAccelerationFilterGet – Gets PID acceleration corrector filter parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)

Description
This function returns PID acceleration corrector filter parameters.

Prototype
int PositionerCorrectorPIDAccelerationFilterGet(
    int SocketID,
    char * PositionerName,
    bool * FilterControlStatus,
    double * KD,
    double * DerivativeFilterCutOffFrequency
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
FilterControlStatus bool * Current position of X axis.
KD double * KD gain.
DerivativeFilterCutOffFrequency double * Derivative Filter Cut-off Frequency (Hz).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.252 PositionerCorrectorPIDAccelerationFilterSet

[Extended]

**Name**

PositionerCorrectorPIDAccelerationFilterSet – Sets PID acceleration corrector filter parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks the motion status (Motion status must be disable): (-117)
- Checks PID Acceleration Filter is enabled: (-205)

**Description**

This function updates PID acceleration corrector filter parameters and enables/disables the filter.

**Prototype**

```c
int PositionerCorrectorPIDAccelerationFilterSet(
    int SocketID,
    char * PositionerName,
    bool * FilterControlStatus,
    double * KD,
    double * DerivativeFilterCutOffFrequency
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.
- **FilterControlStatus** bool Current position of X axis.
- **KD** double KD gain.
- **DerivativeFilterCutOffFrequency** double Derivative Filter Cut-off Frequency (Hz).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -117: Function is only allowed in DISABLED state.
- -205: Not enabled in your configuration.
7.2.1.253 PositionerCorrectorPIDBaseGet [Extended]

Name
PositionerCorrectorPIDBaseGet – Gets PIDBase parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)

Description
This function returns the PIDBase parameter values.

PIDBase parameters:
- MovingMass.
- StaticMass.
- Viscosity.
- Stiffness.

Prototype
int PositionerCorrectorPIDBaseGet(
    int SocketID,
    char * PositionerName,
    double * MovingMass,
    double * StaticMass,
    double * Viscosity,
    double * Stiffness
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
MovingMass double * Mass of the stage moving part.
StaticMass double * Mass of the stage static part (the base).
Viscosity double * Viscosity of the base.
Stiffness double * Stiffness of the base.
**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.254 PositionerCorrectorPIDBaseSet [Extended]

Name
PositionerCorrectorPIDBaseSet – Sets PIDBase parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the parameter values: all values must ≥ 0, else return “Parameter out of range or incorrect” (-17)
- Checks the positioner name: (-18)

Description
This function configures the PIDBase parameters defined for the selected positioner.

PIDBase parameters to set:
- MovingMass.
- StaticMass.
- Viscosity.
- Stiffness.

Prototype
int PositionerCorrectorPIDBaseSet(
    int SocketID,
    char * PositionerName,
    double MovingMass,
    double StaticMass,
    double Viscosity,
    double Stiffness
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
MovingMass double Mass of the stage moving part.
StaticMass double Mass of the stage static part (the base).
Viscosity double Viscosity of the base.
Stiffness double Stiffness of the base.
Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.255 **PositionerCorrectorPIDDualFFVoltageGet**

**Name**
PositionerCorrectorPIDDualFFVoltageGet – Gets PIDDualFFVoltage corrector parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (8)

**Description**
This function returns the corrector parameter values used by a PID dual feed-forward with a motor voltage output.

---

**NOTE**
The “CorrectorType” must be “PIDDualFFVoltage” in the stages.ini file. This servo loop type is used when the position servo loop drives the voltage applied directly to the motor.

**Prototype**
```c
int PositionerCorrectorPIDDualFFVoltageGet(
    int SocketID,
    char * FullPositionerName,
    bool * ClosedLoopStatus,
    double * KP,
    double * KI,
    double * KD,
    double * KS,
    double * IntegrationTime,
    double * DerivativeFilterCutOffFrequency,
    double * GKP,
    double * GKI,
    double * GKD,
    double * KForm,
    double * FeedForwardGainVelocity,
    double * FeedForwardGainAcceleration,
    double * Friction
)
```

**Input parameters**
- **SocketID** int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char *
  Positioner name.
**Output parameters**

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.1.256 PositionerCorrectorPIDDualFFVoltageSet

Name

PositionerCorrectorPIDDualFFVoltageSet – Sets PIDDualFFVoltage corrector parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)
- Checks parameter value: (-17)
  - KP ≥0.
  - KI ≥0.
  - KD ≥0.
  - 0 ≤KS ≤1.
  - IntegrationTime ≥CorrectorISRPeriod.
  - GKP >-1.
  - GKI >-1.
  - GKD >-1.
  - KForm ≥0.
  - KFeedForwardVelocity ≥0.
  - KFeedForwardAcceleration ≥0.
  - Friction ≥0.
  - DerivativeFilterCutOffFrequency \( \frac{0}{\text{CorrectorISRPeriod}} \)

NOTE

Refer to system.ref file to get CorrectorISRPeriod value.

Description

This function configures the “PIDDualFFVoltage” corrector parameters. The “CorrectorType” must be “PIDDualFFVoltage” in the stages.ini file, else (-8) error is returned.

NOTE

This servo loop type is used when the position servo loop drives the voltage applied directly to the motor.
Prototype

```c
int PositionerCorrectorPIDDualFFVoltageSet(
    int SocketID,
    char * FullPositionerName,
    bool ClosedLoopStatus,
    double KP,
    double KI,
    double KD,
    double KS,
    double IntegrationTime,
    double DerivativeFilterCutOffFrequency,
    double GKP,
    double GKI,
    double GKD,
    double KForm,
    double FeedForwardGainVelocity,
    double FeedForwardGainAcceleration,
    double Friction
)
```

Input parameters

- **SocketID**: `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: `char *` Positioner name.
- **ClosedLoopStatus**: `bool` Position servo loop status (true = closed and false = opened).
- **KP**: `double` PID servo loop proportional gain.
- **KI**: `double` PID servo loop integral gain.
- **KD**: `double` PID servo loop derivative gain.
- **KS**: `double` PID integral saturation value (0 to 1).
- **IntegrationTime**: `double` PID integration time (seconds).
- **DerivativeFilterCutOffFrequency**: `double` PID derivative filter cut-off frequency (Hz).
- **GKP**: `double` Variable PID proportional gain multiplier.
- **GKI**: `double` Variable PID integral gain multiplier.
- **GKD**: `double` Variable PID derivative gain multiplier.
- **KForm**: `double` Variable PID form coefficient.
- **FeedForwardGainVelocity**: `double` Velocity feedforward gain (units).
- **FeedForwardGainAcceleration**: `double` Acceleration feedforward gain (units).
- **Friction**: `double` Friction compensation.

Output parameters

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.257 **PositionerCorrectorPIDFFAccelerationGet**

**Name**

`PositionerCorrectorPIDFFAccelerationGet` – Gets PIDFFAcceleration corrector parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)

**Description**

This function returns the corrector parameter values used by a PID feed-forward with an acceleration output.

---

**NOTE**

The “CorrectorType” must be “PIDFFAcceleration” in the stages.ini file. This servo loop type is used when a constant value applied to the driver results in a constant acceleration of the stage.

**Prototype**

```c
int PositionerCorrectorPIDFFAccelerationGet(
    int SocketID,
    char * FullPositionerName,
    bool * ClosedLoopStatus,
    double * KP,
    double * KI,
    double * KD,
    double * KS,
    double * IntegrationTime,
    double * DerivativeFilterCutoffFrequency,
    double * GKP,
    double * GKI,
    double * GKD,
    double * KForm,
    double * FeedForwardGainAcceleration,
    double * FeedForwardGainJerk
)
```

**Input parameters**

- **SocketID** : `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** : `char *` Positioner name.
**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.1.258 PositionerCorrectorPIDFFAccelerationSet

**Name**

`PositionerCorrectorPIDFFAccelerationSet` – Sets PIDFFAcceleration corrector parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)
- Checks parameter value: (-17)
  - KP ≥0.
  - KI ≥0.
  - KD ≥0.
  - 0 ≤KS ≤1.
  - IntegrationTime ≥CorrectorISRPeriod.
  - GKP >-1.
  - GKI >-1.
  - GKD >-1.
  - KForm ≥0.
  - KFeedForwardAcceleration ≥0.
  - KFeedForwardJerk ≥0.
  - DerivativeFilterCutOffFrequency $\leq \frac{0.5}{\text{CorrectorISRPeriod}}$

**NOTE**

Refer to `system.ref` file to get CorrectorISRPeriod value.

**Description**

This function configures the “PIDFFAcceleration” corrector parameters.

**NOTE**

The “CorrectorType” parameter must be defined as “PIDFFAcceleration” in the “stages.ini” file else (-8) error is returned. This servo loop type is used when a constant value applied to the driver results in a constant acceleration of the stage.
Prototype

```c
int PositionerCorrectorPIDFFAccelerationSet(
    int SocketID,
    char * FullPositionerName,
    bool ClosedLoopStatus,
    double KP,
    double KI,
    double KD,
    double KS,
    double IntegrationTime,
    double DerivativeFilterCutOffFrequency,
    double GKP,
    double GKI,
    double GKD,
    double KForm,
    double FeedForwardGainAcceleration,
    double FeedForwardGainJerk
)
```

**Input parameters**

- **SocketID** int  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **ClosedLoopStatus** bool Position servo loop status (true = closed and false = opened).
- **KP** double PID servo loop proportional gain.
- **KI** double PID servo loop integral gain.
- **KD** double PID servo loop derivative gain.
- **KS** double PID integral saturation value (0 to 1).
- **IntegrationTime** double PID integration time (seconds).
- **DerivativeFilterCutOffFrequency** double PID derivative filter cut-off frequency (Hz).
- **GKP** double Variable PID proportional gain multiplier.
- **GKI** double Variable PID integral gain multiplier.
- **GKD** double Variable PID derivative gain multiplier.
- **KForm** double Variable PID form coefficient.
- **FeedForwardGainAcceleration** double Acceleration feedforward gain (units).
- **FeedForwardGainJerk** double Jerk feedforward gain (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
7.2.1.259 PositionerCorrectorPIDFFVelocityGet

**Name**
PositionerCorrectorPIDFFVelocityGet – Gets PIDFFVelocity corrector parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)

**Description**
This function returns the corrector parameter values used by a PID with a velocity output:

**NOTE**
The “CorrectorType” must be “PIDFFVelocity” in the stages.ini file. This servo loop type is used when a constant value applied to the driver results in a constant velocity of the stage.

**Prototype**
```c
int PositionerCorrectorPIDFFVelocityGet(
    int SocketID,
    char * FullPositionerName,
    bool * ClosedLoopStatus,
    double * KP,
    double * KI,
    double * KD,
    double * KS,
    double * IntegrationTime,
    double * DerivativeFilterCutOffFrequency,
    double * GKP,
    double * GKI,
    double * GKD,
    double * KForm,
    double * FeedForwardGainVelocity
);
```

**Input parameters**
- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - char *
  - Positioner name.
Output parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ClosedLoopStatus</td>
<td>bool * Position servo loop status (true = closed and false = opened).</td>

</table>

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.260 PositionerCorrectorPIDFFVelocitySet

Name
PositionerCorrectorPIDFFVelocitySet – Sets PIDFFVelocity corrector parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)
- Checks parameter value: (-17)
  - KP ≥0.
  - KI ≥0.
  - KD ≥0.
  - 0 ≤KS ≤1.
  - IntegrationTime ≥CorrectorISRPeriod.
  - GKP >-1.
  - GKI >-1.
  - GKD >-1.
  - KForm ≥0.
  - KFeedForwardVelocity ≥0.

  DerivativeFilterCutOffFrequency 0 : \[
  \frac{0.5}{\text{CorrectorISRPeriod}}
  \]

NOTE
Refer to `system.ref` file to get CorrectorISRPeriod value.

Description
This function configures the “PIDFFVelocity” corrector parameters.

NOTE
The “CorrectorType” parameter must be defined as “PIDFFVelocity” in the stages.ini file else (-8) error is returned. This servo loop type is used when a constant value applied to the driver results in a constant velocity of the stage.
Prototype

```c
int PositionerCorrectorPIDFFVelocitySet(
    int SocketID,
    char * FullPositionerName,
    bool ClosedLoopStatus,
    double KP,
    double KI,
    double KD,
    double KS,
    double IntegrationTime,
    double DerivativeFilterCutOffFrequency,
    double GKP,
    double GKI,
    double GKD,
    double KForm,
    double FeedForwardGainVelocity
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**
  - char *
  - Positioner name.

- **ClosedLoopStatus**
  - bool
  - Position servo loop status (true = closed and false = opened).

  - double
  - PID derivative filter cut-off frequency (Hz).

- **GKP**
  - double
  - Variable PID proportional gain multiplier.

- **GKI**
  - double
  - Variable PID integral gain multiplier.

- **GKD**
  - double
  - Variable PID derivative gain multiplier.

- **KForm**
  - double
  - Variable PID form coefficient.

- **FeedForwardGainVelocity**
  - double
  - Velocity feedforward gain (units).

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
7.2.1.261 PositionerCorrectorPIPositionGet

Name
PositionerCorrectorPIPositionGet – Gets PIPosition corrector parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)

Description
This function returns the corrector parameter values used by a PI with a position output: ClosedLoopStatus, KP, KI and IntegrationTime.

NOTE
The “CorrectorType” must be “PIPosition” in the stages.ini file. This servo loop type is used when the position servo loop outputs a position value directly.

Prototype
int PositionerCorrectorPIPositionGet(
    int SocketID,
    char * FullPositionerName,
    bool * ClosedLoopStatus,
    double * KP,
    double * KI,
    double * IntegrationTime
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
ClosedLoopStatus bool * Position servo loop status (true = closed and false = opened).
KP double * PI servo loop proportional gain.
KI double * PI servo loop integral gain.
IntegrationTime double * PI integration time (seconds).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.262 **PositionerCorrectorPIPositionSet**

**Name**

*PositionerCorrectorPIPositionSet* – Sets PIPosition corrector parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type and the corrector type: (-8)
- Checks parameter value: (-17)
- \( KP \geq 0 \).
- \( KI \geq 0 \).
- \( \text{IntegrationTime} \geq \text{CorrectorISRPeriod} \).

**NOTE**

Refer to `system.ref` file to get \( \text{CorrectorISRPeriod} \) value.

**Description**

This function configures the “PIPosition” corrector parameters.

**NOTE**

The “CorrectorType” parameter must be defined as “PIPosition” in the `stages.ini` file else ERR_WRONG_OBJECT_TYPE (-8) is returned. This servo loop type is used when the position servo loop outputs a position value directly.

**Prototype**

```c
int PositionerCorrectorPIPositionSet(
    int SocketID,
    char * FullPositionerName,
    bool ClosedLoopStatus,
    double KP,
    double KI,
    double IntegrationTime
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>

<td>PI servo loop integral gain.</td>
</tr>
<tr>
<td>IntegrationTime</td>
<td>double</td>
<td>PI integration time (seconds).</td>
</tr>
</tbody>
</table>
Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.263 PositionerCorrectorPlantFeedForwardDelayGet
[Extended]

Name

PositionerCorrectorPlantFeedForwardDelayGet – Gets the corrector ISR period number configured to define the plant delay.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)

Description

This function returns the corrector ISR period number configured to define the plant delay. Its value is predefined in the stages.ini file with the parameter named “PlantFeedForwardDelayCorrectorISRPeriodNumber”.

Prototype

```c
int PositionerCorrectorPlantFeedForwardDelayGet(
    int SocketID,
    char * PositionerName,
    int * CorractorISRPeriodNumber
)
```

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

PositionerName char * Positioner name.

Output parameters

CorractorISRPeriodNumber int * Number of ISR periods to delay plant

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.264 PositionerCorrectorPlantFeedForwardDelaySet

[Extended]

Name

PositionerCorrectorPlantFeedForwardDelaySet – Sets the corrector ISR period number that defines the plant delay.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the filter number: (-17)
- Checks the motion status (Motion status must be disable): (-117)

Description

This function reconfigures the corrector ISR period number to define the plant delay. Its value is predefined in stages.ini with the parameter “PlantFeedForwardDelayCorrectorISRPeriodNumber”.

Prototype

```c
int PositionerCorrectorPlantFeedForwardDelaySet(
    int SocketID,
    char * PositionerName,
    int CorrectorISRPeriodNumber )
```

Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.
- **CorrectorISRPeriodNumber** int Number of ISR periods to delay plant (max = 100).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
-117: Function is only allowed in DISABLED state.
7.2.1.265 **PositionerCorrectorPostFFGet [Extended]**

**Name**

**PositionerCorrectorPostFFGet** – Gets Post Feed Forward parameters of a PIDFFAccelection corrector.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name: (-18)

**Description**

This function returns the parameters of the current post feed forward from PIDFFAccelection corrector.

**Prototype**

```c
int PositionerCorrectorPostFFGet(
    int SocketID,
    char * PositionerName,
    double * PostKFeedForwardAcceleration,
    double * PostKFeedForwardJerk,
    double * PostKFeedForwardSlope
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - char *
  - Positioner name.

**Output parameters**

- **PostKFeedForwardAcceleration**
  - double *
  - Post KFeedForward acceleration
- **PostKFeedForwardJerk**
  - double *
  - Post KFeedForward jerk
- **PostKFeedForwardSlope**
  - double *
  - Post KFeedForward slop

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-18**: Positioner name doesn’t exist or incorrect.
7.2.1.266 PositionerCorrectorPostFFSet [Extended]

Name
PositionerCorrectorPostFFSet – Sets Post Feed Forward parameters of a PIDFFAcceleration corrector.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

Description
This function sets the parameters of the Post Feed Forward from PIDFFAcceleration corrector.

Prototype
int PositionerCorrectorPostFFSet(
    int SocketID,
    char * PositionerName,
    double PostKFeedForwardAcceleration,
    double PostKFeedForwardJerk,
    double PostKFeedForwardSlope
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
PostKFeedForwardAcceleration double Post KFeedForward acceleration
PostKFeedForwardJerk double Post KFeedForward jerk
PostKFeedForwardSlope double Post KFeedForward slope

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -18: Positioner name doesn’t exist or incorrect.
- -121: Function is not allowed due to configuration disabled.
7.2.1.267 PositionerCorrectorTypeGet

**Name**

PositionerCorrectorTypeGet – Gets the corrector type.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)

**Description**

This function returns the corrector type used by the selected positioner.

The corrector type can be one of this list:

- PositionerCorrectorPIDFFAcceleration.
- PositionerCorrectorPIDFFVelocity.
- PositionerCorrectorPIDDualFFVoltage.
- PositionerCorrectorPIPosition.
- NoCorrector.

---

**NOTE**

The corrector type is defined in the stages.ini file with the “CorrectorType” parameter.

---

**Prototype**

```c
int PositionerCorrectorTypeGet(
    int SocketID,
    char * FullPositionerName,
    char * CorrectorType
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.

**Output parameters**

- **CorrectorType** char * Corrector type.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.268 **PositionerCurrentVelocityAccelerationFiltersGet**

**Name**

*PositionerCurrentVelocityAccelerationFiltersGet* – Gets the velocity and acceleration filter cut-off frequencies.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)

**Description**

This function returns the current velocity cut-off frequency and the current acceleration cut-off frequency used by gathering for the selected positioner. Gathering uses these parameters to filter the current velocity and the current acceleration. These parameters are defined in the stages.ini file.

**Prototype**

```c
int PositionerCurrentVelocityAccelerationFiltersGet(
    int SocketID,
    char * FullPositionerName,
    double * VelocityCutOffFrequency,
    double * AccelerationCutOffFrequency
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.

**Output parameters**

- **VelocityCutOffFrequency** double * Velocity filter cut-off frequency (Hz).
- **AccelerationCutOffFrequency** double * Acceleration filter cut-off frequency (Hz).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.269 **PositionerCurrentVelocityAccelerationFiltersSet**

**Name**

*PositionerCurrentVelocityAccelerationFiltersSet* – Sets the velocity and acceleration filter cut-off frequencies.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks parameter value: (-17)
  
  - VelocityCutOffFrequency
  - AccelerationCutOffFrequency

**NOTE**

Refer to `system.ref` file to get CorrectorISRPeriod value.

**Description**

This function sets a new velocity cut-off frequency and a new acceleration cut-off frequency for the selected positioner. Gathering uses these parameters to filter the current velocity and the current acceleration. These parameters are defined in the `stages.ini` file.

**Prototype**

```c
int PositionerCurrentVelocityAccelerationFiltersSet(
    int SocketID,
    char * FullPositionerName,
    double VelocityCutOffFrequency,
    double AccelerationCutOffFrequency
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char * Positioner name.
- **VelocityCutOffFrequency**: double Velocity filter cut-off frequency (Hz).
- **AccelerationCutOffFrequency**: double Acceleration filter cut-off frequency (Hz).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.270 **PositionerDriverFiltersGet**

**Name**

`PositionerDriverFiltersGet` – Gets the piezo driver notch and low-pass filters parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks driver type (XPS-DRVP1), if not PIEZO: (-24)
- If piezo driver, check if driver is not initialized: (-118)

**Description**

This function returns current values of the piezo driver filters parameters (KI, notch frequency, notch bandwidth, notch gain, low-pass frequency).

**Prototype**

```c
int PositionerDriverFiltersGet(
    int SocketID,
    char * FullPositionerName,
    double * KI,
    double * NotchFrequency,
    double * NotchBandwidth,
    double * NotchGain,
    double * LowpassFrequency
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.
- `FullPositionerName` char*: Positioner name.

**Output parameters**

- `KI` double*: Driver KI.
- `NotchFrequency` double*: Driver notch frequency (Hz).
- `NotchBandwidth` double*: Driver notch bandwidth (Hz).
- `NotchGain` double*: Driver notch gain.
- `LowpassFrequency` double*: Driver low-pass frequency (Hz).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -24: Not available in this configuration (check hardware or configuration).
- -118: Not allowed action driver not initialized.
7.2.1.271 **PositionerDriverFiltersSet**

### Name

*PositionerDriverFiltersSet* – Sets the piezo driver filters parameters.

### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks parameter value: (-17)
  - KI ≥0.
  - NotchFrequency \( 0 : \frac{0.5}{\text{CorrectorISRPeriod}} \)
  - NotchBandwidth \( 0 : \frac{0.5}{\text{CorrectorISRPeriod}} \)
  - NotchGain \([0:100]\)
  - LowpassFrequency \( 0 : \frac{0.5}{\text{CorrectorISRPeriod}} \)
- Checks driver type, if not PIEZO: (-24)
- If the group state is NOTREF or READY: (-117)
- If the driver is not initialized: (-118)

### Description

This function sets parameters of the driver (KI integral, notch and low-pass filters) for a piezo driver positioner.

### Prototype

```c
int PositionerDriverFiltersSet(
    int SocketID,
    char * FullPositionerName,
    double KI,
    double NotchFrequency,
    double NotchBandwidth,
    double NotchGain,
    double LowpassFrequency
)
```
**Input parameters**

- **SocketID** int  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **KI** double  Driver KI.
- **NotchFrequency** double  Driver notch frequency (Hz).
- **NotchBandwidth** double  Driver notch bandwidth (Hz).
- **NotchGain** double  Driver notch gain.
- **LowpassFrequency** double  Driver low-pass frequency (Hz).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-24:** Not available in this configuration (check hardware or configuration).
- **-50:** Motor initialization error. Check InitializationAccelerationLevel, ScalingAcceleration, MaximumJerkTime, EncoderResolution or EncoderScalePitch.
- **-117:** Function is only allowed in DISABLED state.
- **-118:** Not allowed action driver not initialized.
7.2.1.272 PositionerDriverPositionOffsetsGet

Name

PositionerDriverPositionOffsetsGet - Gets the current value of piezo driver stage and gage position offsets.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks driver type, if not PIEZO: (-24)
- If the group state is NOTREF or READY: (-117)
- If the driver is not initialized: (-118)

Description

This function returns current value of the piezo driver position offset parameters (stage position offset, gage position offset).

Prototype

```c
int PositionerDriverPositionOffsetsGet(
    int SocketID,
    char * FullPositionerName,
    double * StagePositionOffset,
    double * GagePositionOffset
)
```

Input parameters

- **SocketID** int - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * - Positioner name.

Output parameters

- **StagePositionOffset** double * - Driver stage position offset (units).
- **GagePositionOffset** double * - Driver gage position offset (units).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -117: Function is only allowed in DISABLED state.
- -118: Not allowed action driver not initialized.
7.2.1.273 PositionerDriverStatusGet

**Name**
PositionerDriverStatusGet – Gets the positioner driver status code.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must be not a secondary positioner): (-18), (-24)

**Description**
This function returns the positioner driver status from the driver board.
Use the “PositionerDriverStatusStringGet” function to get the driver status description.

**NOTE**
See section 8.7: “Positioner Driver Status List”.

**Prototype**
```c
int PositionerDriverStatusGet(
    int SocketID,
    char * FullPositionerName,
    unsigned long * PositionerDriverStatus
)
```

**Input parameters**
- **SocketID**: int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char *
  Positioner name.

**Output parameters**
- **PositionerDriverStatus**: unsigned long *
  Driver status code.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner name doesn't exist or unknown command.
- **-24**: Not available in this configuration (check hardware or configuration).
7.2.1.274 PositionerDriverStatusStringGet

**Name**

PositionerDriverStatusStringGet – Gets the positioner driver status description.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns a driver status description from a positioner driver status code.

---

**NOTE**

See section 8.7: “Positioner Driver Status List”.

---

**Prototype**

```c
int PositionerDriverStatusStringGet(
    int SocketID,
    int DriverStatusCode,
    char * DriverStatusString
)
```

**Input parameters**

- **SocketID**
  int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **DriverStatusCode**
  unsigned long
  Driver status code.

**Output parameters**

- **DriverStatusString**
  char *
  Driver status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**
  No error.
7.2.1.275 PositionerEncoderAmplitudeValuesGet

Name
PositionerEncoderAmplitudeValuesGet – Gets the encoder amplitude values.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner: (-8)
- Checks the encoder type (must be “AnalogInterpolated”): (-8)

Description
This function returns the maximum and current amplitudes values (in volts) of the analog encoder input.

NOTE
The encoder type must be “AnalogInterpolated” in the stages.ini file (“EncoderType” parameter).

Prototype
int PositionerEncoderAmplitudeValuesGet(
    int SocketID,
    char * FullPositionerName,
    double * MaxSinusAmplitude,
    double * CurrentSinusAmplitude,
    double * MaxCosinusAmplitude,
    double * CurrentCosinusAmplitude
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
MaxSinusAmplitude double * Encoder sinus signal maximum amplitude value (Volts).
CurrentSinusAmplitude double * Encoder sinus signal current amplitude value (Volts).
MaxCosinusAmplitude double * Encoder cosinus signal maximum amplitude value (Volts).
CurrentCosinusAmplitude double * Encoder cosinus signal current amplitude value (Volts).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.276 **PositionerEncoderCalibrationParametersGet**

**Name**

*PositionerEncoderCalibrationParametersGet* – Gets the encoder calibration parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must be not a secondary positioner): (-8)
- Checks the encoder type (must be “AnalogInterpolated”): (-8)

**Description**

After a calibration of the analog encoder input (by the function “GroupInitializeWithEncoderCalibration”), this function returns the optimum parameters for the analog encoder interface. To take these parameters into account (recommended to achieve best performance), these values must be entered manually in the corresponding section of the stages.ini file. The parameters to set in the stages.ini file are:

- EncoderSinusOffset = ; Volts
- EncoderCosinusOffset = ; Volts
- EncoderDifferentialGain =
- EncoderPhaseCompensation = ; Deg

**NOTE**

The encoder type must be “AnalogInterpolated” in the stages.ini file (“EncoderType” parameter).

**Prototype**

```c
int PositionerEncoderCalibrationParametersGet(  
    int SocketID,  
    char * FullPositionerName,  
    double * SinusOffset,  
    double * CosinusOffset,  
    double * DifferentialGain,  
    double * PhaseCompensation  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.

**Output parameters**

- **SinusOffset** double * Encoder sinus signal offset (Volts).
- **CosinusOffset** double * Encoder cosinus signal offset (Volts).
- **DifferentialGain** double * Encoder differential gain.
- **PhaseCompensation** double * Encoder phase compensation (Deg).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.277 **PositionersEncoderIndexDifferenceGet**

**Name**
PositionersEncoderIndexDifferenceGet – Gets the distance between the two index encoders (gantry).

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxis or an XY): (-8)
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks the positioner name: (-18)
- Checks the positioner type (must be “gantry”): (-24)
- Checks the positioner was at least once homed: (-109)

**Description**
This function returns the distance between the two encoders indexes of a “primary positioner – secondary positioner” couple. To use this function, the positioner must be configured in “gantry” mode else (-24) error is returned.

For further information about gantry mode, refer to the “SYSTEM – Manual Configuration – Gantries (Secondary Positioners)” section in the XPS User’s Manual.

**Prototype**

```c
int PositionersEncoderIndexDifferenceGet(
    int SocketID,
    char * FullPositionerName
    double * Distance
)
```

**Input parameters**

- **SocketID**
  - `int`: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - `char *`: Positioner name.

**Output parameters**

- **Distance**
  - `double *`: Distance between the two index encoders (units).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-109**: Group need to be homed at least once to use this function (distance measured during homing).
7.2.1.278 PositionerEncoderLinearCorrectionGet

**Name**

PositionerEncoderLinearCorrectionGet – Gets encoder linear correction in ppm.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)

**Description**

This function returns encoder linear correction in ppm.

**Prototype**

```c
int PositionerEncoderLinearCorrectionGet ( 
    int SocketID,
    char * PositionerName,
    double * EncoderLinearCorrection
 )
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**

- **EncoderLinearCorrection** double * Encoder linear correction (ppm).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.279 **PositionerEncoderLinearCorrectionSet**

**Name**

`PositionerEncoderLinearCorrectionSet` – Sets encoder linear correction in ppm.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks group state (must be NOTINIT, DISABLE or READY at HomePreset position): (-205)

**Description**

This function sets encoder linear correction in ppm.

**Prototype**

```c
int PositionerEncoderLinearCorrectionSet (  
    int SocketID,  
    char * PositionerName,  
    double EncoderLinearCorrection  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.
- **EncoderLinearCorrection** double Encoder linear correction in ppm

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-205:** Not enable in your configuration.
7.2.1.280 **PositionerErrorGet**

**Name**

**PositionerErrorGet** – Gets the positioner error code and clears it.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid positioner name: (-18)
- Valids secondary positioner: (-18)

**Description**

This function gets the positioner error code and clears it.

The positioner error codes are listed in section 8.5: “Positioner Error List”. The description of the positioner error code can be obtained with the “GroupPositionerErrorStringGet” function.

---

**NOTE**

The “PositionerErrorRead” function reads the positioner error without clearing it.

**Prototype**

```c
int PositionerErrorGet(  
    int SocketID,  
    char * FullPositionerName,  
    int * PositionerError  
  )
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char Positioner name.

**Output parameters**

- **PositionerError** int Positioner error code.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-24**: Not available in this configuration (check hardware or configuration).
7.2.1.281 **PositionerErrorRead**

**Name**

**PositionerErrorRead** – Gets the positioner error code without clearing it.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid positioner name: (-18)
- Valids secondary positioner: (-18)

**Description**

This function gets the positioner error code without clearing it. The positioner error codes are listed in section 8.5: “Positioner Error List”. The description of the positioner error code can be obtained with the “GroupPositionerErrorStringGet” function.

---

**NOTE**

The “PositionerErrorGet” function clears the positioner error.

---

**Prototype**

```c
int PositionerErrorRead(
    int SocketID,
    char * FullPositionerName,
    int * PositionerError
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.

**Output parameters**

- **PositionerError** int * Positioner error code.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-24**: Not available in this configuration (check hardware or configuration).
7.2.1.282 PositionerErrorStringGet

**Name**
PositionerErrorStringGet – Gets the positioner error description.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function returns a positioner error description from a positioner error code.

---

**NOTE**
See section 8.5: “Positioner Error List”.

---

**Prototype**

```c
int PositionerErrorStringGet(
    int SocketID,
    char * FullPositionerName,
    int PositionerErrorCode,
    char * PositionerErrorString
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char *
  - Positioner name.
- **PositionerErrorCode**: int
  - Positioner error code.

**Output parameters**

- **PositionerErrorString**: int *
  - Positioner error description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
7.2.1.283 PositionerExcitationSignalGet

Name
PositionerExcitationSignalGet – Gets the currently used parameters of the excitation signal feature.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Invalid positioner name: (-18)

Description
This function gets the last configured excitation signal parameters.

Prototype
int PositionerExcitationSignalGet(  
    int SocketID,  
    char * FullPositionerName,  
    int * SignalType,  
    double * Frequency,  
    double * Amplitude,  
    double * Time  
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
SignalType int * Type of signal.
Frequency double * Frequency (Hz).
Amplitude double * Amplitude (acceleration, velocity or voltage unit).
Time double * During time (seconds).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.284 \textbf{PositionerExcitationSignalSet}

\textbf{Name}

\textit{PositionerExcitationSignalSet} – Sets and activate the signal of excitation.

\textbf{Input tests}

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid object type: (-8)
- Is secondary positioner or has a secondary positioner: (-8)
- Checks frequency (must ≥ 0.1 and ≤ 0.5/CorrectorISRPeriod): (-17)
- Checks excitation time (must ≥ 4 * CorrectorISRPeriod): (-17)
- Checks signal amplitude [-Acceleration (Velocity or Voltage) limit to Acceleration (Velocity or Voltage) limit]: (-17)
- Checks type of signal (0, 1, 2 or 3): (-17)
- Invalid positioner name: (-18)
- Checks group status (must be READY): (-22)
- Valid control loop type: (-24)
- Error if XY secondary positioner and in Option 0 (-222)

\textbf{Description}

The excitation signal functionality generates a typical signal (a sine, a blank noise or an echelon signal) that the controller sends to motors to excite the system. In measuring the output signal of the excited system, we can determine some system characteristics, like the system transfer function.

The excitation signal functionality is only available with the stages controlled in acceleration (acceleration control, ex: brushless / linear motors), velocity (velocity control) or in voltage (voltage control). It does not exist with the stages controlled in position (ex: stepper motors).

The excitation-signal function \textit{PositionerExcitationSignalSet} can be executed only when the positioner is in “READY” state. When the excitation-signal process is in progress, the positioner is in the “ExcitationSignal” state. At the end of the process, the positioner returns to “READY” state (see group state diagram).

The \textit{PositionerExcitationSignalSet} function sends an excitation signal to the motor for a brief time. This function is allowed for “PIDFFAcceleration”, “PIDFFVelocity” or “PIDDualFFVoltage” control loops. The parameters to configure are signal type (0:sine, 1:echelon, 2:random-amplitude, 3:random-pulse-width binary-amplitude, integer), frequency (Hz, double), amplitude (acceleration, velocity or voltage unit, double) and during time (seconds, double).

The function effective parameters for each mode are: (here: Limit means AccelerationLimit, VelocityLimit or VoltageLimit)

- Sine signal mode: Frequency (≥0.1 and ≤0.5/CorrectorISRPeriod), Amplitude (>0 and ≤Limit), Time (≥4 * CorrectorISRPeriod)
- Echelon signal mode: Amplitude (>0 and ≤Limit, or <0 and ≥-Limit), Time(≥4 * CorrectorISRPeriod) + During Time: Signal = Amplitude + End of Time: Signal = 0
- Random-amplitude signal mode: Amplitude (>0 and ≤Limit), Time(>0), Frequency (≥0.1 and ≤0.5/CorrectorISRPeriod)
Signal is generated with a random value at with a period defined by the controller base time \((\text{CorrectorISRPeriod}, \text{default value} \ 0.125 \ms)\), then is filtered with a second order low-pass filter at the cut-off \(Frequency\) value.

- Random-pulse-width binary-amplitude signal mode:
  \(Amplitude \ (>0 \text{ and} \leq \text{Limit}), \ Time \ (\geq 4 \times \text{CorrectorISRPeriod}), \ Frequency \ (\geq 0.1 \text{ and} \leq 0.5/\text{CorrectorISRPeriod})\).

Signal is a sequence of pulses \((Signal = Amplitude \ or \ = 0)\) with pulse randomly varied width (multiple of Tbase).

\(Frequency\) is the controlled system band-width (cut-off frequency), necessary for the PRBS (Pseudo Random Binary Sequence) function configuration.

The function non-effective parameters can accept any value, the value 0 is recommended for simplicity.

---

**NOTE**

If during the excitation signal generation the stage position exceeds the user minimum or maximum target positions, the motor excitation command is stopped and an error is returned.

---

**Prototype**

```c
int PositionerExcitationSignalSet(
    int SocketID,
    char * FullPositionerName,
    int SignalType,
    double Frequency,
    double Amplitude,
    double Time
)
```

**Input parameters**

- **SocketID**
  - Type: `int`
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**
  - Type: `char *`
  - Description: Positioner name.

- **SignalType**
  - Type: `int`
  - Description: Type of signal.

- **Frequency**
  - Type: `double`
  - Description: Frequency (Hz).

- **Amplitude**
  - Type: `double`
  - Description: Amplitude (acceleration, velocity or voltage unit).

- **Time**
  - Type: `double`
  - Description: During time (seconds).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -112: Error of excitation signal generation initialization.
- -222: Action not allowed for secondary positioner that is in Option 0
7.2.1.285 **PositionerExcitationSignalCorrectorOutSet**

**Name**

`PositionerExcitationSignalCorrectorOutSet` – Sets and activates the signal of excitation that is inserted at corrector output.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Is secondary positioner or has a secondary positioner: (-8)
- Checks frequency (must \( \geq 0.1 \) and \( \leq 0.5/\text{CorrectorISRPeriod} \)): (-17)
- Checks excitation time (must \( \geq 4 \times \text{CorrectorISRPeriod} \)): (-17)
- Checks signal amplitude \([- \text{Acceleration} (\text{Velocity or Voltage}) \text{ limit to Acceleration (Velocity or Voltage) limit}] \): (-17)
- Checks type of signal (0, 1, 2 or 3): (-17)
- Invalid positioner name: (-18)
- Checks group status (must be READY): (-22)
- Valids control loop type: (-24)
- Error if XY secondary positioner and in Option 0 (-222)

**Description**

The excitation signal functionality generates a typical signal (a sine, a blank noise or an echelon signal) that the controller sends to motors to excite the system. In measuring the output signal of the excited system, we can determine some system characteristics, like the system transfer function.

The excitation signal functionality is only available with the stages controlled in acceleration (acceleration control, ex: brushless / linear motors), velocity (velocity control) or in voltage (voltage control). It does not exist with the stages controlled in position (ex: stepper motors).

The excitation-signal function `PositionerExcitationSignalCorrectorOutSet` can be executed only when the positioner is in “READY” state. When the excitation-signal process is in progress, the positioner is in the “ExcitationSignal” state. At the end of the process, the positioner returns to “READY” state (see group state diagram).

The `PositionerExcitationSignalCorrectorOutSet` function sends an excitation signal to the motor for a brief time. This function is allowed for “PIDFFAcceleration”, “PIDFFVelocity” or “PIDDualFFVoltage” control loops. The parameters to configure are `signal type` (0:sine, 1:echelon, 2:random-amplitude, 3:random-pulse-width binary-amplitude, integer), `frequency` (Hz, double), `amplitude` (acceleration, velocity or voltage unit, double) and `during time` (seconds, double).

The function effective parameters for each mode are: (here: Limit means AccelerationLimit, VelocityLimit or VoltageLimit)

- Sine signal mode: Frequency (\( \geq 0.1 \) and \( \leq 0.5/\text{CorrectorISRPeriod} \)), Amplitude (\( >0 \) and \( \leq \text{Limit} \)), Time (\( \geq 4 \times \text{CorrectorISRPeriod} \))
- Echelon signal mode: Amplitude (\( >0 \) and \( \leq \text{Limit} \), or \( <0 \) and \( \geq -\text{Limit} \)), Time(\( \geq 4 \times \text{CorrectorISRPeriod} \))
  + During Time: \( \text{Signal} = \text{Amplitude} \)
  + End of Time: \( \text{Signal} = 0 \)
- Random-amplitude signal mode: Amplitude (>0 and ≤Limit), Time(>0), Frequency (≥0.1 and ≤0.5/CorrectorISRPeriod)
  
  Signal is generated with a random value at with a period defined by the controller base time (CorrectorISRPeriod, default value 0.125 ms), then is filtered with a second order low-pass filter at the cut-off Frequency value.

- Random-pulse-width binary-amplitude signal mode:
  
  \[ \text{Amplitude} \geq 0 \text{ and } \leq \text{Limit}, \text{Time} \geq 4 \times \text{CorrectorISRPeriod}, \text{Frequency} \geq 0.1 \text{ and } \leq 0.5/\text{CorrectorISRPeriod} \]

  Signal is a sequence of pulses (Signal = Amplitude or = 0) with pulse randomly varied width (multiple of Tbase).

  Frequency is the controlled system bandwidth (cut-off frequency), necessary for the PRBS (Pseudo Random Binary Sequence) function configuration.

  The function non-effective parameters can accept any value, the value 0 is recommended for simplicity.

---

**NOTE**

If during the excitation signal generation the stage position exceeds the user minimum or maximum target positions, the motor excitation command is stopped and an error is returned.

---

**NOTE**

This function does exactly the same that the function PositionerExcitationSignalSet() does, with only one difference between them. The difference is that, with the function PositionerExcitationSignalCorrectorOutSet(), the generated excitation signal is inserted at the corrector output, that can be useful in some cases, like the measurement of robustness transfer function.

---

**Prototype**

```c
int PositionerExcitationSignalCorrectorOutSet(
    int SocketID,
    char * FullPositionerName,
    int SignalType,
    double Frequency, 
    double Amplitude,
    double Time
)
```

**Input parameters**

- **SocketID**
  - Type: `int`
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - Type: `char *`
  - Description: Positioner name.
- **SignalType**
  - Type: `int`
  - Description: Type of signal.
- **Frequency**
  - Type: `double`
  - Description: Frequency (Hz).
- **Amplitude**
  - Type: `double`
  - Description: Amplitude (acceleration, velocity or voltage unit).
- **Time**
  - Type: `double`
  - Description: During time (seconds).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -112: Error of excitation signal generation initialization.
- -222: Action not allowed for secondary positioner that is in Option 0
7.2.1.286 PositionerFeedforwardAccDisable [Extended]

Name
PositionerFeedforwardAccDisable – Disables XY External Feed Forward Acceleration signal.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

Description
Disable XY External Feed Forward Acceleration signal.
This function is reserved for an XY group.

Prototype
int PositionerFeedforwardAccDisable(
    int SocketID,
    char * PositionerName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
7.2.1.287 PositionerFeedforwardAccEnable [Extended]

Name
PositionerFeedforwardAccEnable – Enables XY External Feed forward Acceleration signal.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)
- Checks the group is ready: (-135)

Description
Enable XY External Feed Forward Acceleration signal.
This function is reserved for an XY group.

Prototype
int PositionerFeedforwardAccEnable(
    int SocketID,
    char * PositionerName
);

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
- -135: Function is not allowed because group is not initialized or not referenced.
7.2.1.288 PositionerFeedforwardAccGet [Extended]

Name
PositionerFeedforwardAccGet – Gets parameters of XY external feed forward acceleration signal.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

Description
Gets parameters of the current XY external feed forward acceleration signal.

Prototype
int PositionerFeedforwardAccGet(int SocketID, char * PositionerName, char * OutputName1, double * Scale1, double * Offset1, char * OutputName2, double * Scale2, double * Offset2)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
OutputName1 char * GPIO Analog Output name #1
Scale1 double * Signal 1 scale
Offset1 double * Signal 1 offset
OutputName2 char * GPIO Analog Output name #2
Scale2 double * Signal 2 scale
Offset2 double * Signal 2 offset

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
### 7.2.1.289 `PositionerFeedforwardAccSet [Extended]`

**Name**

`PositionerFeedforwardAccSet` – Sets parameters of XY external feed forward acceleration signal.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

**Description**

Sets parameters of the current XY external feed forward acceleration signal.

**Prototype**

```c
int PositionerFeedforwardAccSet(
    int SocketID,
    char * PositionerName,
    char * OutputName1,
    double Scale1,
    double Offset1,
    char OutputName2,
    double Scale2,
    double Offset2
)
```

**Input parameters**

- **SocketID**
  - `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - `char *` Positioner name.
- **OutputName1**
  - `char *` GPIO Analog Output name #1
- **Scale1**
  - `double` Signal 1 scale
- **Offset1**
  - `double` Signal 1 offset
- **OutputName2**
  - `char *` GPIO Analog Output name #2
- **Scale2**
  - `double` Signal 2 scale
- **Offset2**
  - `double` Signal 2 offset

**Output parameters**

None.
**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-121:** Not enable in your configuration.
7.2.1.290 **PositionerFeedforwardAccStatusGet** [Extended]

**Name**

*PositionerFeedforwardAccStatusGet* – Gets XY external feed forward acceleration status.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

**Description**

Get status of the current XY external feed forward acceleration:
- “Enabled” means XY external feed forward acceleration is in progress.
- “Disabled” means XY external feed forward acceleration is stopped.

**Prototype**

```c
int PositionerFeedforwardAccStatusGet(
    int SocketID,
    char * PositionerName,
    char * Status
)
```

**Input parameters**

- **SocketID** int
  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **PositionerName** char *
  
  Positioner name.

**Output parameters**

- **OutputName1** char *
  
  GPIO Analog Output name #1

- **Status** char *
  
  Current XY external feed forward status: “Enabled” or “Disabled”

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-121:** Not enable in your configuration.
7.2.1.291 **PositionerFeedforwardPositionDisable** [Extended]

**Name**

*PositionerFeedforwardPositionDisable* – Disables XY External Feed forward Position signal.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Checks the positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

**Description**

Disables XY External Feed forward Position signal.
This function is reserved for an XY group.

**Prototype**

```c
int PositionerFeedforwardPositionDisable(  
    int SocketID,  
    char * PositionerName  
)  
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-121:** Not enable in your configuration.
7.2.1.292 PositionerFeedforwardPositionEnable [Extended]

Name
PositionerFeedforwardPositionEnable – Enables XY External Feed Forward Position signal.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Checks the positioner name: (-18)
- Not allowed due to configuration disabled: (-121)
- Checks the group status is “READY”: (-135)

Description
Enables XY External Feed Forward Position signal.
This function is reserved for an XY group.

Prototype
int PositionerFeedforwardPositionEnable(
   int SocketID,
   char * PositionerName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
- -135: Function is not allowed because group is not initialized or not referenced.
7.2.1.293 PositionerFeedforwardPositionGet [Extended]

**Name**

PositionerFeedforwardPositionGet – Gets parameters of XY External Feed forward Position signal.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Checks the positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

**Description**

Gets parameters of XY External Feed forward Position signal. This function is reserved for an XY group.

**Prototype**

```c
int PositionerFeedforwardPositionGet(
    int SocketID,
    char * PositionerName,
    char * OutputName,
    double * Scale,
    double * Offset
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**: char * Positioner name.

**Output parameters**

- **OutputName**: char * GPIO Analog Output name
- **Scale**: double * Signal scale
- **Offset**: double * Signal offset

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-121**: Not enable in your configuration.
7.2.1.294 PositionerFeedforwardPositionSet [Extended]

Name
PositionerFeedforwardPositionSet – Sets parameters of XY External Feed forward Position signal.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Checks the positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

Description
Sets parameters of XY External Feed forward Position signal.
This function is reserved for an XY group.

Prototype
int PositionerFeedforwardPositionSet(
    int SocketID,
    char * PositionerName,
    char * OutputName,
    double Scale,
    double Offset
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.
OutputName char * GPIO analog output name
Scale double Signal scale
Offset double Signal offset

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
7.2.1.295 `PositionerFeedforwardPositionStatusGet` [Extended]

**Name**

`PositionerFeedforwardPositionStatusGet` – Gets XY external feed forward position status.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Positioner must not be a “Secondary Positioner” and the group must be a XY group: (-8)
- Invalid positioner name: (-18)
- Not allowed due to configuration disabled: (-121)

**Description**

Get status of the current XY external feed forward position:
- “Enabled” means XY external feed forward position is in progress.
- “Disabled” means XY external feed forward position is stopped.

**Prototype**

```c
int PositionerFeedforwardPositionStatusGet(
    int SocketID,
    char * PositionerName,
    char * Status
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char *: Positioner name.

**Output parameters**

- **OutputName1** char *: GPIO Analog Output name #1
- **Status** char *: Current XY external feed forward status: “Enabled” or “Disabled”

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -121: Not enable in your configuration.
7.2.1.296 PositionerGantryEndReferencingPositionGet

**Name**
PositionerGantryEndReferencingPositionGet – Gets the secondary axis position at the end of group home search.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner type (must be a primary positioner): (-8)
- Checks group type: (-8)
  - SingleAxis.
  - SingleAxisTheta.
  - SingleAxisWithClamping.
  - XY.
  - MultipleAxes.
- Checks positioner name: (-18)
- Checks if positioner has a SecondaryPositioner (must be gantry): (-24)
- Checks if homing is done: (-109)

**Description**
This function gets the saved corrected Setpoint position of the secondary positioner at the end of group home search.

**Prototype**
```
int PositionerGantryEndReferencingPositionGet(
    int SocketID,
    char PositionerName,
    double * Position
)
```

**Input parameters**
- **SocketID** int: Socket identifier gets by the TCP_ConnectToServer” function.
- **PositionerName** int: Positioner name.

**Output parameters**
- **Position** double *: SecondaryPositioner Setpoint Position at the end of home (units).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -24: Not available in this configuration (check hardware or configuration).
- -109: Group need to be homed at least once to use this function (distance measured during home search).
7.2.1.297 PositionerHardInterpolatorFactorGet

**Name**

PositionerHardInterpolatorFactorGet – Gets the interpolation factor for position compare mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must be not a secondary positioner): (-8)
- Checks the encoder type (must be “AnalogInterpolated”): (-8)

**Description**

This function returns the interpolation factor of the hardware interpolator used in the “Position Compare” mode. The interpolation factor value is defined as:

\[
\text{InterpolationFactor} = \text{round} \left( \frac{\text{EncoderScalePitch}}{\text{HardInterpolatorResolution}} \right)
\]

**NOTE**

The encoder type must be “AnalogInterpolated” in the stages.ini file (“EncoderType” parameter).

**Prototype**

\[
\text{int PositionerHardInterpolatorFactorGet}(
\text{int SocketID, char * FullPositionerName, int * InterpolationFactor})
\]

**Input parameters**

- **SocketID**: int, Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char *, Positioner name.
- **Output parameters**.
- **InterpolationFactor**: int *, interpolation factor.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.298 PositionerHardInterpolatorFactorSet

**Name**

**PositionerHardInterpolatorFactorSet** – Sets the interpolation factor for position compare mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must be not a secondary positioner): (-8)
- Checks the encoder type (must be “AnalogInterpolated”): (-8)
- Checks input parameter value: (-17)
- Checks the positioner name: (-18)
- Checks the group state (must be NOTINIT): (-22)

**Description**

This function sets the interpolation factor of the hardware interpolator used in the “PositionCompare” mode. The IP200 is updated and the position compare resolution is set as follows:

\[
\text{PositionCompareResolution} = \frac{\text{EncoderScalePitch}}{\text{InterpolationFactor}}
\]

The “InterpolationFactor” value must be define with one of these values:

| 20 | 25 | 40 | 50 | 80 | 100 | 160 | 200 |

If the input interpolator factor value is different from these values then (-17) error is returned.

**NOTE**

The group must be NOTINIT to use this function else (-22) error is returned.

The encoder type must be “AnalogInterpolated” in the stages.ini file (“EncoderType” parameter) else the error is returned.

This function applies to XPS-Q hardware. It is kept for XPS-D and XPS-RL backward compatibility but has no effect.

**Prototype**

```c
int PositionerHardInterpolatorFactorSet(
    int SocketID,
    char * FullPositionerName,
    int InterpolationFactor
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **InterpolationFactor** int interpolation factor.

**Output parameters**

None.
**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.299 `PositionerHardInterpolatorPositionGet [Extended]`

**Name**

`PositionerHardInterpolatorPositionGet` – Gets interpolated position from the encoder hard interpolator.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)
- Checks the encoder type (must be “AnalogInterpolated”): (-8)

**Description**

This function returns the position interpolated by the encoder hard interpolator.

---

**NOTE**

The encoder type must be “AnalogInterpolated” or “AnalogInterpolatedTheta” in the stages.ini file (“EncoderType” parameter).

---

**Prototype**

```c
int PositionerHardInterpolatorPositionGet(
    int SocketID,
    char * FullPositionerName,
    double * Position
)
```

**Input parameters**

- `SocketID` int – Socket identifier gets by the “TCP_ConnectToServer” function.
- `FullPositionerName` char * – Positioner name.

**Output parameters**

- `Position` double * – Interpolated position.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
### 7.2.1.300 PositionerHardwareStatusGet

**Name**

*PositionerHardwareStatusGet* – Gets the positioner hardware status code.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must be not a secondary positioner): (-8), (-18), (-24)

**Description**

This function returns the hardware status of the selected positioner. The positioner hardware status is composed of the “corrector” hardware status and the “servitudes” hardware status:

- The “Corrector” returns the motor interface and the position encoder hardware status.
- The “Servitudes” returns the general inhibit and the end of runs hardware status.

**NOTE**

See section 8.6: “Positioner Hardware Status List”.

**Prototype**

```c
int PositionerHardwareStatusGet(
    int SocketID,
    char * FullPositionerName,
    int * PositionerHardwareStatus
)
```

**Input parameters**

- **SocketID**
  - int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - char *: Positioner name.

**Output parameters**

- **PositionerHardwareStatus**
  - int *: Hardware status code.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
### 7.2.1.301 PositionerHardwareStatusStringGet

**Name**

PositionerHardwareStatusStringGet – Gets the positioner error description.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the hardware status description from a positioner hardware status code.

**NOTE**

See section 8.6: “Positioner Hardware Status List”.

**Prototype**

```c
int PositionerHardwareStatusStringGet(  
    int SocketID,  
    char * FullPositionerName,  
    int PositionerHardwareStatusCode,  
    char * PositionerHardwareStatusString  
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char *: Positioner name.
- **PositionerHardwareStatusCode** int: Positioner hardware status code.

**Output parameters**

- **PositionerHardwareStatusString** int *: Positioner hardware status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
7.2.1.302 \texttt{PositionerJogMaximumVelocityAndAccelerationGet}

\textbf{Name}

\texttt{PositionerJogMaximumVelocityAndAccelerationGet} – Gets the jog maximum velocity and jog maximum acceleration from profiler generator.

\textbf{Input tests}

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name: (-18)

\textbf{Description}

This function returns the jog maximum velocity and jog maximum acceleration of the profile generators. These parameters represent the limits for the profiler and are defined in the stages.ini file:

\begin{align*}
\text{JogMaximumVelocity} &= ; \text{unit/second} \\
\text{JogMaximumAcceleration} &= ; \text{unit/second}^2
\end{align*}

\textbf{Prototype}

\begin{verbatim}
int PositionerJogMaximumVelocityAndAccelerationGet(
    int SocketID,
    char * FullPositionerName,
    double * JogMaximumVelocity,
    double * JogMaximumAcceleration
)
\end{verbatim}

\textbf{Input parameters}

- \texttt{SocketID} \hspace{1cm} \texttt{int} \hspace{0.5cm} Socket identifier gets by the “TCP_ConnectToServer” function.
- \texttt{PositionerName} \hspace{0.5cm} \texttt{char *} \hspace{0.5cm} Positioner name.

\textbf{Output parameters}

- \texttt{JogMaximumVelocity} \hspace{0.5cm} \texttt{double *} \hspace{0.5cm} Jog maximum velocity (units/s).
- \texttt{JogMaximumAcceleration} \hspace{0.5cm} \texttt{double *} \hspace{0.5cm} Jog maximum acceleration (units/s²).

\textbf{Return} (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: \hspace{1cm} No error.
- -8: \hspace{1cm} Wrong object type for this command.
- -18: \hspace{1cm} Positioner Name doesn't exist or unknown command.
7.2.1.303 PositionerMagneticTrackPositionAtHomeGet

Name
PositionerMagneticTrackPositionAtHomeGet – Gets magnetic track position at home in units.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)

Description
This function returns magnetic track position at home in units.

Prototype
int PositionerMagneticTrackPositionAtHomeGet(
    int SocketID,
    char * PositionerName,
    double * MagneticTrackPosition
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
MagneticTrackPosition double * Magnetic track position at home (units).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.304 `PositionerMagneticTrackPositionAtHomeSet`

**Name**

`PositionerMagneticTrackPositionAtHomeSet` – Sets magnetic track position at home in units.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks group state (must be NOTINIT, DISABLE or READY at HomePreset position): (-205)

**Description**

This function sets magnetic track position at home in units.

**Prototype**

```
int PositionerMagneticTrackPositionAtHomeSet(
    int SocketID,
    char * PositionerName,
    double MagneticTrackPosition
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.
- `PositionerName` char*: Positioner name.
- `MagneticTrackPosition` double: Magnetic track position at home (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -205: Not enable in your configuration.
7.2.1.305 PositionerMaximumVelocityAndAccelerationGet

**Name**
PositionerMaximumVelocityAndAccelerationGet – Gets the maximum velocity and acceleration from the profiler generators.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)

**Description**
This function returns the maximum velocity and acceleration of the profile generators. These parameters represent the limits for the profiler and are defined in the stages.ini file:

MaximumVelocity = ; unit/second
MaximumAcceleration = ; unit/second²

**Prototype**
```c
int PositionerMaximumVelocityAndAccelerationGet(
    int SocketID,
    char * FullPositionerName,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**
- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - char *
  - Positioner name.

**Output parameters**
- **MaximumVelocity**
  - double *
  - Maximum velocity (units/seconds).
- **MaximumAcceleration**
  - double *
  - Maximum acceleration (units/seconds²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
7.2.1.306 \texttt{PositionerMotionDoneGet}

\textbf{Name}

\texttt{PositionerMotionDoneGet} – Gets the motion done parameters.

\textbf{Input tests}

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)
- Checks the motion done mode (must be “VelocityAndPositionWindow”): (-8)

\textbf{Description}

This function returns the motion done parameters only for the “VelocityAndPositionWindow” MotionDone mode. If the MotionDone mode is defined as “Theoretical” then (-8) error is returned.

The “MotionDoneMode” parameter from the stages.ini file defines the motion done mode. The motion done can be defined as “Theoretical” (the motion done mode is not used) or “VelocityAndPositionWindow”. For a more thorough description of the motion done mode, please refer to the XPS Motion Tutorial section Motion/Motion Done.

\textbf{Prototype}

\begin{verbatim}
int PositionerMotionDoneGet(  
    int SocketID,  
    char * FullPositionerName,  
    double * PositionWindow,  
    double * VelocityWindow,  
    double * MeanPeriod  
    double * Timeout  
)
\end{verbatim}

\textbf{Input parameters}

- \texttt{SocketID} \hspace{1cm} \texttt{int} \hspace{1cm} Socket identifier gets by the “TCP_ConnectToServer” function.
- \texttt{FullPositionerName} \hspace{1cm} \texttt{char *} \hspace{1cm} Positioner name.

\textbf{Output parameters}

- \texttt{PositionWindow} \hspace{1cm} \texttt{double *} \hspace{1cm} Position window (units).
- \texttt{VelocityWindow} \hspace{1cm} \texttt{double *} \hspace{1cm} Velocity window (units/seconds).
- \texttt{CheckingTime} \hspace{1cm} \texttt{double *} \hspace{1cm} Checking time (seconds).
- \texttt{MeanPeriod} \hspace{1cm} \texttt{double *} \hspace{1cm} Mean period (seconds).
- \texttt{Timeout} \hspace{1cm} \texttt{double *} \hspace{1cm} Motion done time out (seconds).

\textbf{Return} (In addition to the results of “Input Tests Common to all XPS Functions”)

\begin{itemize}
  \item 0: No error.
  \item -8: Wrong object type for this command.
\end{itemize}
7.2.1.307 PositionerMotionDoneSet

**Name**

PositionerMotionDoneSet – Sets the motion done parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks parameter value: (-17)

**Description**

This function updates the motion done parameters only for the “VelocityAndPositionWindow” MotionDone mode. The “MotionDoneMode” parameter from the stages.ini file must be defined as “VelocityAndPositionWindow” else (-8) error is returned.

For a more thorough description of the Motion Done mode, please refer to the XPS Motion Tutorial section Motion/Motion Done.

**Prototype**

```c
int PositionerMotionDoneSet(
    int SocketID,
    char * FullPositionerName,
    double PositionWindow,
    double VelocityWindow,
    double MeanPeriod,
    double Timeout
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>

<td>MeanPeriod</td>
<td>double</td>
<td>Mean period (seconds).</td>
</tr>
<tr>
<td>Timeout</td>
<td>double</td>
<td>Motion done time out (seconds).</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
7.2.1.308 PositionerMotorDualSinForceBalanceGet

**Name**

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the motor driver interface type is AnalogDualSinAcceleration or AnalogDualSinAccelerationLMI (error -205 otherwise).

**Description**

This function returns the force balance parameters of an AnalogDualSinAcceleration or AnalogDualSinAccelerationLMI motor driver interface.

**Prototype**

```c
int PositionerMotorDualSinForceBalanceGet(
    int SocketID,
    char * FullPositionerName,
    double * FirstMotorForceBalance,
    double * SecondMotorForceBalance
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char * Full positioner name (for example XYZ).

**Output parameters**

- **FirstMotorForceBalance**: double * First force balance ratio.
- **SecondMotorForceBalance**: double * Second force balance ratio.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-205**: Not enable in your configuration.
7.2.1.309 PositionerMotorDualSinForceBalanceSet

Name

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the motor driver interface type is AnalogDualSinAcceleration or AnalogDualSinAccelerationLMI (error -205 otherwise).

Description
This function sets the force balance parameters of an AnalogDualSinAcceleration or AnalogDualSinAccelerationLMI motor driver interface.

Prototype
int PositionerMotorDualSinForceBalanceSet(
    int SocketID,
    char * FullPositionerName,
    double FirstMotorForceBalance,
    double SecondMotorForceBalance
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Full positioner name (for example XY.X).
FirstMotorForceBalance double First force balance ratio (value between 0 and 1).
SecondMotorForceBalance double Second force balance ratio (between 0 and 1).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -205: Not enable in your configuration.
7.2.1.310 \texttt{PositionerPositionCompareAquadBAlwaysEnable}

**Name**

\texttt{PositionerPositionCompareAquadBAlwaysEnable} – Enables the AquadB signal in
the always mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks if the CIE board supports this function: (-115)

**Description**

This function enables the generation of AquadB output signals on the PCO connector
(the 2&3 or 4&5 pins) of the XPS controller cards. The “always” mode means that the
AquadB signal is generated all the time (not position windowed).

\begin{center}
\textbf{NOTE}
\end{center}

This function can be used only with a position encoder. If there is no position
encoder then (-24) error is returned.

**Prototype**

\begin{verbatim}
int PositionerPositionCompareAquadBAlwaysEnable(
    int SocketID,
    char * FullPositionerName
)
\end{verbatim}

**Input parameters**

- \texttt{SocketID} \hspace{1cm} int \hspace{1cm} Socket identifier gets by the
  “TCP_ConnectToServer” function.
- \texttt{FullPositionerName} \hspace{1cm} char * \hspace{1cm} Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS
Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.311 **PositionerPositionCompareAquadBPrescalerGet**

**Name**

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks encoder type (must be “AnalogInterpolated” encoder): (-8)
- Checks parameter value: (-17)
- Checks positioner name: (-18)

**Description**
This function gets the current Position Compare AquadB interpolation factor.
The predefined PCO interpolation values are the following:
- 4.
- 16.
- 256.
- 4096.
- 65536.

**Prototype**
```c
int PositionerPositionCompareAquadBPrescalerGet(
    int SocketID,
    char PositionerName,
    double * PCOInterpolationFactor
)
```

**Input parameters**
- SocketID: int Socket identifier gets by the TCP_ConnectToServer” function.
- PositionerName: int Positioner name.

**Output parameters**
- PCOInterpolationFactor: double * Current PCO interpolation factor.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner name doesn't exist or unknown command.
7.2.1.312 PositionerPositionCompareAquadBPrescalerSet

**Name**

PositionerPositionCompareAquadBPrescalerSet – Sets PCO AquadB interpolation factor.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks encoder type (must be “AnalogInterpolated” encoder): (-8)
- Checks PCO interpolation factor value: (-17)
- Checks positioner name: (-18)

**Description**

This function configures Position Compare AquadB interpolation factor. The predefined PCO interpolation values are the following:

- 4
- 16
- 256
- 4096
- 65536

**Prototype**

```c
int PositionerPositionCompareAquadBPrescalerSet(  
    int SocketID,  
    char PositionerName,  
    double PCOInterpolationFactor  
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the TCP_ConnectToServer” function.
- **PositionerName** int: Positioner name.
- **PCOInterpolationFactor** double: Predefined PCO interpolation factor value.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.313 PositionerPositionCompareAquadBWindowedGet

**Name**

PositionerPositionCompareAquadBWindowedGet – Gets the windowed AquadB mode parameters and state..

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks the position compare parameters (must be configured): (-23)
- Checks the configured mode type (must be WindowedAquadB): (-24)
- Checks if the CIE board supports this function: (-115)

**Description**

This function returns the configured parameters of the position windowed AquadB output signal and gives its state (enabled or disabled).

**NOTE**

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”). If there is no position encoder then (-24) error is returned.

**Prototype**

```c
int PositionerPositionCompareAquadBWindowedGet (int SocketID, char FullPositionerName[250] , double* MinimumPosition, double* MaximumPosition, bool * EnableState)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.

**Output parameters**

- **MinimumPosition** double * Minimum position (units).
- **MaximumPosition** double * Maximum position (units).
- **EnableState** bool * Windowed AquadB state (true=enabled or false=disabled)

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -23: ERR_POSITION_COMPARE_NOT_SET.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.314 PositionerPositionCompareAquadBWindowedSet

**Name**

PositionerPositionCompareAquadBWindowedSet – Sets the windowed AquadB signal parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks input parameter values: (-17)
  - MinimumPosition < MaximumPosition.
  - MinimumPosition ≥ MinimumTargetPosition.
  - MaximumPosition ≤ MaximumTargetPosition.
- Checks position compare state (must be disabled): (-22)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks if the CIE board supports this function: (-115)

**Description**

This function sets the parameters for the position windowed AquadB output signal on the PCO connector (the 2&3 or 4&5 pins) of the XPS controller cards. These parameters are in effect only when the position compare mode is enabled by the PositionerPositionCompareEnable() function.

**NOTE**

This function can be used only with a position encoder (“AquadB” or “AnalogInterpolated”). If there is no position encoder then (-24) error is returned.

**Prototype**

```c
int PositionerPositionCompareAquadBWindowedSet(
    int SocketID,
    char * FullPositionerName
    double MinimumPosition,
    double MaximumPosition
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * Positioner name.
- **MinimumPosition** double Minimum position (units).
- **MaximumPosition** double Maximum position (units).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.315 PositionerPositionCompareDisable

Name

PositionerPositionCompareDisable – Disables the position compare mode.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)
- Checks the encoder ("AquadB" or "AnalogInterpolated"): (-8)

Description

This function disables the position compare mode.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

Prototype

int PositionerPositionCompareDisable(
    int SocketID,
    char * FullPositionerName
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.316 PositionerPositionCompareEnable

Name
PositionerPositionCompareEnable – Enables the position compare mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)
- Checks the encoder (“AquadB” or “AnalogInterpolated”): (-8)
- Checks the positioner name: (-18)
- Checks the group state (must be READY): (-22)
- Checks the position compare parameters (must be configured): (-22)

Description
This function enables the position compare mode. The group must be in READY state to use this function else (-22) error is returned.
If the position compare parameters are not configured (by the “PositionerPositionCompareSet” function) then (-22) error is returned.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

Prototype
int PositionerPositionCompareEnable(
    int SocketID,
    char * FullPositionerName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -22: Not allowed action.
7.2.1.317 **PositionerPositionCompareGet**

**Name**

`PositionerPositionCompareGet` – Gets the position compare parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)
- Checks the position compare parameters (must be configured): (-23)
- Checks the configured mode type (must be PositionCompare): (-24)

**Description**

This function returns the real value (without correction) of parameters of the position compare output trigger and returns current state (enabled or disabled).

For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

**Prototype**

```c
int PositionerPositionCompareGet(
    int SocketID,
    char * FullPositionerName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * PositionStep,
    bool * EnableState
)
```

**Input parameters**

- **SocketID**
  - `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - `char *` Positioner name.

**Output parameters**

- **MinimumPosition**
  - `double *` Minimum position (units).
- **MaximumPosition**
  - `double *` Maximum position (units).
- **PositionStep**
  - `double *` Position step (units).
- **EnableState**
  - `bool *` Position compare state (true = enabled or false = disabled).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-23:** Position compare not set.
- **-24:** Not available in this configuration (check hardware or configuration).
7.2.1.318 PositionerPositionComparePulseParametersGet

Name
PositionerPositionComparePulseParametersGet – Gets the position compare PCO pulse parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner (must not be a secondary positioner): (-8)

Description
This function returns the configured parameters of the position compare PCO pulse parameters.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

Prototype
int PositionerPositionComparePulseParametersGet(
    int SocketID,
    char * FullPositionerName,
    double * PCOPulseWidth,
    double * EncoderSettlingTime
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
PCOPulseWidth double * Width of PCO pulses (μs).
EncoderSettlingTime double * Encoder signal settling time (μs).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.319 PositionerPositionComparePulseParametersSet

**Name**

PositionerPositionComparePulseParametersSet – Sets the position compare PCO pulse parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks input parameter values: (-17)
  - PCOPulseWidth value must equal to 0.2 (default), 1, 2.5 or 10 (µs)
  - EncoderSettlingTime value must equal to 0.075 (default), 1, 4 or 12 (µs)
- Checks position compare state (must be disabled): (-22)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)
- Checks if the CIE board supports this function: (-115)

**Description**

This function sets two additional parameters for the position compare output trigger of the PCO connector on the XPS controller cards. The first additional parameter is the pulse width. The second parameter is the encoder settling time value, which is the time the encoder inputs have to stabilize after a change of state is detected. These parameters are used only when using the position compare mode. For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

---

**NOTE**

When changing the PCO Pulse settle time you must limit the maximum velocity of the stage accordingly, otherwise you will loose the PCO position and generate the wrong number of pulses at wrong positions.

For example, if you set the EncoderSettlingTime to 4 µs, the maximum PCO encoder frequency need to be limited to less than 0.25 / 4e^{-6} = 62.5 kHz.

So, if EncoderScalePitch = 0.004 mm and HardInterpolatorFactor = 200 then the stage maximum velocity must ≤62.5e^{3} * 0.004 / 200 = 1.25 mm/s, otherwise the PCO will not work properly.

How to determine PCO encoder frequency:

1. For AquadB encoder:
   
   \[ \text{PCO encoder frequency} = \frac{\text{Velocity}}{\text{EncoderResolution}} \]

2. For analog interpolated encoder:
   
   \[ \text{PCO encoder frequency} = \frac{\text{Velocity} \times \text{HardInterpolatorFactor}}{\text{EncoderScalePitch}} \]

**Example:** XML310 stage (EncoderScalePitch = 0.004 mm, HardInterpolatorFactor = 200). If Velocity = 10mm/s = >PCO encoder frequency = 10 * 200/0.004 = 500 kHz
NOTE

This function can be used only with a position encoder. If no position encoder then (-24) error is returned.

This function is called automatically at controller reboot and at GroupInitialize() execution to set the position compare pulse parameters to default values (PCOPulseWidth to 0.2 µs, EncoderSettlingTime to 0.075 µs).

Prototype

```c
int PositionerPositionComparePulseParametersSet(
    int SocketID,
    char * FullPositionerName,
    double PCOPulseWidth,
    double EncoderSettlingTime
)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**: char * Positioner name.
- **PCOPulseWidth**: double Width of PCO pulses (µs).
- **EncoderSettlingTime**: double Encoder signal settling time (µs).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.320 PositionerPositionCompareScanAccelerationLimitGet [Extended]

**Name**
PositionerPositionCompareScanAccelerationLimitGet – Gets the position compare scan acceleration limit.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the corrector type (must be PIDFFAcceleration corrector): (-24)

**Description**
This function returns the position compare scan acceleration limit.
During scan of position compare, the motor output will be limited to this value instead of the AccelerationLimit.
The position compare scan acceleration limit takes effect only with PIDFFAcceleration corrector type.
This function can be used only with a PIDFFAcceleration corrector else (-24) error is returned.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

**Prototype**
```c
int PositionerPositionCompareScanAccelerationLimitGet(
    int SocketID,
    char * FullPositionerName,
    double * ScanAccelerationLimit
)
```

**Input parameters**
- SocketID: int Socket identifier gets by the “TCP_ConnectToServer” function.
- FullPositionerName: char * Positioner name.

**Output parameters**
- ScanAccelerationLimit: double * Limit of position compare scan acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.321 PositionerPositionCompareScanAccelerationLimitSet [Extended]

Name
PositionerPositionCompareScanAccelerationLimitSet – Sets the position compare acceleration limit.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter values: (-17)
  - PositionCompareScanAccelerationLimit value must >0 and ≤ MaximumAcceleration (value in stages.ini)
- Checks the corrector type (must be PIDFFAcceleration corrector): (-24)

Description
This function sets the position compare scan acceleration limit.
During position compare, the motor output will be limited to this value instead of AccelerationLimit.
The position compare scan acceleration limit takes effect only with PIDFFAcceleration corrector type.
This function can be used only with a PIDFFAcceleration corrector otherwise the (-24) error is returned.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

Prototype
int PositionerPositionCompareScanAccelerationLimitSet(
    int SocketID,
    char * FullPositionerName,
    double * ScanAccelerationLimit
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.
ScanAccelerationLimit double Limit of position compare scan acceleration (units/s²).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -24: Not available in this configuration (check hardware or configuration).
7.2.1.322 PositionerPositionCompareSet

**Name**

PositionerPositionCompareSet – Sets the position compare parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type: (-8)
- Checks input parameter values: (-17)
  - MinimumPosition < MaximumPosition.
  - MinimumPosition ≥ MinimumTargetPosition.
  - MaximumPosition ≤ MaximumTargetPosition.
  - 0 ≤ PositionStep ≤ (MaximumPosition – MinimumPosition)
- Checks position compare state (must be disabled): (-22)
- Checks the position encoder (“AquadB” or “AnalogInterpolated”): (-24)

**Description**

This function sets the parameters for the position compare output trigger of the PCO connector on the XPS controller cards.

These parameters are used only when the position compare mode is enabled. For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

---

**NOTE**

This function can be used only with a position encoder. If no position encoder then (-24) error is returned.

In the PositionCompare mode (activated with PositionerPositionCompareEnable() function), during the move (relative or absolute) and inside the zone set by PositionerPositionCompareSet(), if the current following error exceeds the Warning Following Error value, the PositionCompareWarningFollowingErrorFlag is activated and the move returns an error (-120: Warning following error during move with position compare enabled). To reset the PositionCompareWarningFollowingErrorFlag, send the PositionerPositionCompareDisable() function. The WarningFollowingError is set to FatalFollowingError (defined in stages.ini file) by default, but it can be modified by PositionerWarningErrorSet().

In the PositionCompare mode (activated with PositionerPositionCompareEnable() function), during the move (relative or absolute) and inside the zone set by PositionerPositionCompareSet(), the CorrectorOutput is limited to MaximumAcceleration (defined in stages.ini).
Prototype

```c
int PositionerPositionCompareSet(
    int SocketID,
    char * FullPositionerName,
    double MinimumPosition,
    double MaximumPosition,
    double PositionStep,
    bool EnableState
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**
  - char *
  - Positioner name.

- **MinimumPosition**
  - double
  - Minimum position (units).

- **MaximumPosition**
  - double
  - Maximum position (units).

- **PositionStep**
  - double
  - Position step (units).

- **EnableState**
  - bool
  - Position compare state (true = enabled or false = disabled).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-22**: Not allowed action.
- **-24**: Not available in this configuration (check hardware or configuration).
7.2.1.323 PositionerPreCorrectorExcitationSignalGet

[Extended]

Name

PositionerPreCorrectorExcitationSignalGet – Gets the currently used parameters of the pre-corrector excitation signal feature.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid object type: (-8)
- Invalid positioner name: (-18)

Description

This function gets the last configured pre-corrector excitation signal parameters.

Prototype

int PositionerPreCorrectorExcitationSignalGet(
    int SocketID,
    char * FullPositionerName
    double * Frequency,
    double * Amplitude,
    double * Time
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

FullPositionerName char * Positioner name.

Output parameters

Frequency double * Frequency (Hz).

Amplitude double * Amplitude (position units).

Time double * During time (seconds).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.324 PositionerPreCorrectorExcitationSignalSet

Name

PositionerPreCorrectorExcitationSignalSet – Configures and activate the signal of pre-corrector excitation.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Validates object type: (-8)
- Is secondary positioner or has a secondary positioner: (-8)
- Checks frequency (must ≥0.1 and ≤0.5/CorrectorISRPeriod): (-17)
- Checks amplitude (must >0): (-17)
- Checks excitation time (must ≥4 * CorrectorISRPeriod): (-17)
- Invalid positioner name: (-18)
- Checks group status (must be READY): (-22)
- Validates control loop type: (-24)
- Checks maximum velocity (Amplitude * ω < MaximumVelocity): (-68)
- Checks maximum acceleration (Amplitude * ω² < MaximumAcceleration): (-69)
- Error if XY secondary positioner and in Option 0: (-222)

Description

The pre-corrector excitation signal functionality generates sine-wave signals (ExcitationPosition, ExcitationVelocity, ExcitationAcceleration, ExcitationJerk) inserted in the position control loop (in closed or open loop configuration) to excite the system. In measuring the output signal (e.g. encoder position, velocity or acceleration) of the excited system, we can determine some system characteristics, like the system transfer function.

The exact forms of generated pre-corrector excitation signals are as follows:

\[ \omega = 2\pi F \] (F: excitation frequency)

\[ \text{ExcitationPosition} = A \cdot \cos(\omega t) \] (A: excitation amplitude, t: current time)

\[ \text{ExcitationVelocity} = (-A\omega) \cdot \sin(\omega t) \]

\[ \text{ExcitationAcceleration} = (-A\omega^2) \cdot \cos(\omega t) \]

\[ \text{ExcitationJerk} = (A\omega^3) \cdot \sin(\omega t) \]

The pre-corrector excitation signal functionality is only available with the stages controlled in acceleration (acceleration control, e.g. brushless / linear motors), velocity (velocity control) or in voltage (voltage control). It does not exist with stages controlled in position (e.g. stepper motors).

The excitation signal function PositionerPreCorrectorExcitationSignalSet can be executed only when the positioner is in “READY” state. When the excitation-signal process is in progression, the positioner is in the “ExcitationSignal” state. At the end of the process, the positioner returns to the “READY” state (see group state diagram).

The PositionerPreCorrectorExcitationSignalSet function sends a sine form excitation signal to entry of position control loop during a time. This function is allowed for “PIDFFAcceleration”, “PIDFFVelocity” or “PIDDualFFVoltage” control loops. The
parameters to configure include: frequency (Hz, double), amplitude (position unit, double) and during time (seconds, double).

The function effective parameters are: Frequency (≥0.1 and ≤0.5/CorrectorISRPeriod), Amplitude (>0), Time (≥4 * CorrectorISRPeriod).

**NOTE**
If during the excitation signal generation the stage position exceeds the user minimum or maximum target positions, the motor excitation command is stopped and an error is returned.

**Prototype**

```c
int PositionerPreCorrectorExcitationSignalSet(
    int SocketID,
    char * FullPositionerName
    double Frequency,
    double Amplitude,
    double Time
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the "TCP_ConnectToServer" function.
- **FullPositionerName**
  - char *
  - Positioner name.
- **Frequency**
  - double
  - Frequency (Hz).
- **Amplitude**
  - double
  - Amplitude (position units).
- **Time**
  - double
  - During time (seconds).

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -35: Position is outside of travel limits.
- -68: Velocity on trajectory is too big.
- -69: Acceleration on trajectory is too big.
- -112: Error of excitation signal generation initialization.
- -222: Action not allowed for secondary positioner that is in Option 0.
7.2.1.325 PositionerRawEncoderPositionGet

Name
PositionerRawEncoderPositionGet – Gets the raw encoder position for a positioner.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Invalid positioner name: (-18)

Description
This function returns the raw encoder position from a corrected position for a positioner.

Prototype
int PositionerRawEncoderPositionGet(
    int SocketID,
    char * FullPositionerName
    double UserEncoderPosition,
    double * RawEncoderPosition
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.
UserEncoderPosition double User corrected encoder position.

Output parameters
RawEncoderPosition double * Raw encoder position.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.326 **PositionerSGammaExactVelocityAjustedDisplacementGet**

**Name**

*PositionerSGammaExactVelocityAjustedDisplacementGet* – Gets the adjusted displacement to get exact velocity.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the profiler type (must be “SGamma”): (-8)
- Checks the positioner type (must not be a secondary positioner): (-8)

**Description**

This function returns the closest optimum displacement to obtain the most precise velocity during the displacement.

**Prototype**

```c
int PositionerSGammaExactVelocityAjustedDisplacementGet(
    int SocketID,
    char * FullPositionerName,
    double DesiredDisplacement,
    double * AdjustedDisplacement
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
<tr>
<td>DesiredDisplacement</td>
<td>double</td>
<td>Desired displacement (units).</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdjustedDisplacement</td>
<td>double *</td>
<td>Adjusted displacement (units).</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.1.327 PositionerSGammaMoveResultGet

**Name**
PositionerSGammaMoveResultGet – Gets the motion information of the last Sgamma move.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)

**Description**
This function gets the motion results from the SGamma last move.

**Prototype**
```c
int PositionerSGammaMoveResultGet ( int SocketID,
        char * FullPositionerName
        double * TimeToAccelerate,
        double * RealAcceleration,
        double * DistanceToAccelerate,
        double * TimeAtConstantSpeed,
        double * RealVelocity,
        double * DistanceAtConstantSpeed,
        double * TotalTimeToMove,
        double * DistanceToDecelerate,
        double * ExecutedDisplacement,
    )
```

**Input parameters**
- **SocketID**  int Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**  char * Positioner name.

**Output parameters**
- **TimeToAccelerate**  double * Time to reach real acceleration (seconds).
- **RealAcceleration**  double * Maximum acceleration during last move (units/seconds²).
- **DistanceToAccelerate**  double * Distance to reach real acceleration (units).
- **TimeAtConstantSpeed**  double * Time at real velocity (seconds).
- **RealVelocity**  double * Maximum velocity during last move (units/seconds).
- **DistanceAtConstantSpeed**  double * Distance at real velocity (seconds).
- **TotalTimeToMove**  double * Total time to execute last move (seconds).
- **DistanceToDecelerate**  double * Distance to decelerate (units).
- **ExecutedDisplacement**  double * Real displacement during last move (units).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
7.2.1.328 PositionerSGammaParametersGet

Name
PositionerSGammaParametersGet – Gets the current motion values from the SGamma profiler.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the profiler type (must be “SGamma”): (-8)
- Checks the positioner type (must not be a secondary positioner): (-8)

Description
This function gets the current SGamma profiler values that are used in displacements.

Prototype
int PositionerSGammaParametersGet(
    int SocketID,
    char * FullPositionerName
    double * Velocity,
    double * Acceleration,
    double * MinimumJerkTime,
    double * MaximumJerkTime
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
Velocity double * motion velocity (units/seconds).
Acceleration double * motion acceleration (units/seconds²).
MinimumJerkTime double * Minimum jerk time (seconds).
MaximumJerkTime double * Maximum jerk time (seconds).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.1.329 PositionerSGammaParametersSet

**Name**

PositionerSGammaParametersSet – Sets new motion values for the SGamma profiler.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the profiler type (must be “SGamma”): (-8)
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks input parameter values: (-17)
  - \(0 < \text{NewVelocity} \leq \text{MaximumVelocity}\).
  - \(0 < \text{NewAcceleration} \leq \text{MaximumAcceleration}\).
  - \(2 \times \text{ISRProfileGeneratorPeriod} \leq \text{NewMinimumJerkTime}\) and \(\leq \text{NewMaximumJerkTime}\).

**Description**

This function defines the new SGamma profiler values that will be used in future displacements.

**Prototype**

```c
int PositionerSGammaParametersSet(
    int SocketID,  
    char * FullPositionerName, 
    double Velocity, 
    double Acceleration, 
    double MinimumJerkTime, 
    double MaximumJerkTime
)
```

**Input parameters**

- **SocketID** int – Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char * – Positioner name.
- **Velocity** double – motion velocity (units/seconds).
- **Acceleration** double – motion acceleration (units/seconds²).
- **MinimumJerkTime** double – Minimum jerk time (seconds).
- **MaximumJerkTime** double – Maximum jerk time (seconds).

**Output parameters**

None.
**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
### 7.2.1.330 PositionerSGammaPreviousMotionTimesGet

**Name**

*PositionerSGammaPreviousMotionTimesGet* – Gets the motion and the settling time.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the profiler type (must be “SGamma”): (-8)
- Checks the positioner type (must not be a secondary positioner): (-8)

**Description**

This function returns the motion (setting) and settling times from the previous motion.

The motion time represents the defined time to complete the previous displacement.

The settling time represents the effective settling time for a motion done.

**Description**

This function gets the current SGamma profiler values that are used in displacements.

**Prototype**

```c
int PositionerSGammaPreviousMotionTimesGet(
    int SocketID,
    char * FullPositionerName
    double * SettingTime,
    double * SettlingTime
)
```

**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**: char *  
  Positioner name.

**Output parameters**

- **SettingTime**: double *  
  Setting time (seconds).

- **SettlingTime**: double *  
  Settling time (seconds).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
7.2.1.331 **PositionerSGammaVelocityAndAccelerationSet**

**Name**
PositionerSGammaVelocityAndAccelerationSet – Sets the SGamma profiler velocity and acceleration.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter values: (-17)
  - $0 < \text{NewVelocity} \leq \text{MaximumVelocity}$
  - $0 < \text{NewAcceleration} \leq \text{MaximumAcceleration}$

**Description**
The function sets the SGamma profiler velocity and acceleration that will be used for future displacements.

**Prototype**
```c
int PositionerSGammaVelocityAndAccelerationSet(
    int SocketID,
    double Velocity,
    double Acceleration
)
```

**Input parameters**
- **SocketID**: int. Socket identifier gets by the “TCP_ConnectToServer” function.
- **Velocity**: double. Motion velocity (units / seconds).
- **Acceleration**: double. Motion acceleration (units / seconds²).

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- $0$: No error.
- $-17$: Parameter out of range or incorrect.
7.2.1.332 PositionerStageParameterGet

Name

PositionerStageParameterGet – Gets a stage parameter value from the stages.ini file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name and the parameter name: (-24)

Description

This function returns stage parameter values from the stages.ini file of a selected positioner.

The positioner name is the stage name. And the parameter name is read in the section under this stage name.

Prototype

int PositionerStageParameterGet(
    int SocketID,
    char * FullPositionerName,
    char * ParameterName,
    char * ParameterValue
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.
ParameterName char * Parameter name.

Output parameters

ParameterValue char * Parameter value.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -13: Wrong parameter type in the command string: char * expected.
- -24: Not available in this configuration (check hardware or configuration).
7.2.1.333 PositionerStageParameterSet

Name

PositionerStageParameterSet – Saves a stage parameter value into the stages.ini file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name and the parameter name: (-24)
- Checks the user rights (must be identified as administrator): (-107)

Description

This function saves a stage parameter value in the “stages.ini” file.
The positioner name sets the stage name and the parameter name is searched in the
section of this stage name. Once the parameter is found, the parameter value is modified
to the new value.
If file reading fails then (-61) error is returned
If file writing fails then (-60) error is returned

NOTE

To use this function, the user must login with administrator rights (“Login”
function).

Prototype

int PositionerStageParameterSet(
    int SocketID,
    char * FullPositionerName
    char * ParameterName,
    char * ParameterValue
)

Input parameters

SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.
ParameterName char * Parameter name.

Output parameters

ParameterValue char * Parameter value.

Return (In addition to the results of “Input Tests Common to all XPS
Functions”)

- 0: No error.
- -24: Not available in this configuration (check hardware or configuration).
- -60: Error during file writing or file doesn't exist.
- -61: Error file corrupt or file doesn't exist.
- -107: This function requires to be logged in with Administrator rights.
7.2.1.334 **PositionerTimeFlasherDisable**

**Name**

*PositionerTimeFlasherDisable* – Disables the time flasher mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)

**Description**

This function disables the time flasher mode. The time flasher mode is a trigger output per axis that can be either configured to output distance spaced pulses or time spaced pulses. The output pulses are accessible from the PCO connector at the back of the XPS controller.

For a more thorough description of the position compare output, please refer to the XPS User’s manual, section named Triggers/Position Compare Output.

**Prototype**

```c
int PositionerTimeFlasherDisable(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

- **SocketID**
  
  * int
  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName**
  
  * char *
  
  Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.1.335 **PositionerTimeFlasherEnable**

**Name**

*PositionerTimeFlasherEnable* – Enables the time flasher mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks the time flasher parameters (must be configured): (-22)

**Description**

This function enables the time flasher mode. The time flasher mode is a trigger output per axis that can be either configured to output distance spaced pulses or time spaced pulses. The output pulses are accessible from the PCO connector at the back of the XPS controller.

To use this function, the group must be in READY state else (-22) error is returned.

For a more thorough description of the position compare output, please refer to the XPS User's manual, section named Triggers/Position Compare Output.

**Prototype**

```c
int PositionerTimeFlasherEnable(
    int SocketID,
    char * FullPositionerName
)
```

**Input parameters**

- **SocketID**
  - *int*
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName**
  - *char*
  - Positioner name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.1.336 PositionerTimeFlasherGet

**Name**

*PositionerTimeFlasherGet* – Gets the time flasher parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks the time flasher parameters (must be configured): (-23)
- Checks the configured mode type (must be TimeFlasher): (-24)

**Description**

This function returns the parameters of the time flasher trigger. The time flasher mode is defined by:

- a position window defined by a minimum position and a maximum position
- a time period to set the time spaced pulses.

For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

**Prototype**

```c
int PositionerTimeFlasherGet(  
    int SocketID,  
    char * FullPositionerName,  
    double * MinimumPosition,  
    double * MaximumPosition,  
    double * TimePeriod,  
    bool * EnableState  
)
```

**Input parameters**

- **SocketID** int 
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **FullPositionerName** char * 
  Positioner name.

**Output parameters**

- **MinimumPosition** double * 
  Minimum position (units).

- **MaximumPosition** double * 
  Maximum position (units).

- **TimePeriod** double * 
  Time period (seconds).

- **EnableState** bool * 
  Enable time flasher state (true = enabled and false = disabled).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-23:** Position compare not set.
- **-24:** Not available in this configuration (check hardware or configuration).
7.2.1.337 PositionerTimeFlasherSet

Name
PositionerTimeFlasherSet – Sets the time flasher parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks input parameter values: (-17)
  • MinimumPosition < MaximumPosition.
  • MinimumPosition ≥ MinimumTravelLimit.
  • MaximumPosition ≤ MaximumTravelLimit.
  • 0.0000004 ≤ TimePeriod ≤ 50.0 (Max 2.5 MHz and Min 0.02 Hz)
- Checks the time flasher state (must be disabled): (-22)
- Checks the position encoder (must be used): (-24)
- Checks if the CIE board supports this function: (-115)

Description
This function configures the time flasher parameters. The time flasher output trigger uses the PCO connector on the XPS controller cards. The time flasher mode is defined by:

• a position window defined by a minimum position and a maximum position.
• a time period to set the time spaced pulses.

NOTES
This function is not available without a position encoder.
These parameters are used only when the time flasher mode is enabled. To enable the time flasher mode, use the “PositionerPositionCompareEnable” function.
For a more thorough description of the position compare output, please refer to the XPS Motion Tutorial section Triggers/Position Compare Output.

Prototype
int PositionerTimeFlasherSet(
    int SocketID,
    char * FullPositionerName,
    double MinimumPosition,
    double MaximumPosition,
    double TimePeriod,
    bool EnableState
)
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>FullPositionerName</td>
<td>char *</td>
<td>Positioner name.</td>
</tr>
<tr>
<td>MinimumPosition</td>
<td>double</td>
<td>Minimum position (units).</td>
</tr>
<tr>

<td>double</td>
<td>Maximum position (units).</td>
</tr>
<tr>
<td>TimePeriod</td>
<td>double</td>
<td>Time period (seconds).</td>
</tr>
<tr>
<td>EnableState</td>
<td>bool</td>
<td>Enable time flasher state (true = enabled and false = disabled).</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -24: Not available in this configuration (check hardware or configuration).
- -115: Function is not supported by current hardware.
7.2.1.338 PositionerUserTravelLimitsGet

**Name**
PositionerUserTravelLimitsGet – Gets the user travel limits.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- If piezo driver, check if driver is not initialized: (-118)

**Description**
This function returns the user-defined travel limits for the selected positioner.

**Prototype**
```c
int PositionerUserTravelLimitsGet(
    int SocketID,
    char * FullPositionerName,
    double * UserMinimumTarget,
    double * UserMaximumTarget
)
```

**Input parameters**
- **SocketID** int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char *
  Positioner name.

**Output parameters**
- **UserMinimumTarget** double *
  User minimum travel limit (units).
- **UserMaximumTarget** double *
  User maximum travel limit (units).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -118: Not allowed action driver not initialized.
7.2.1.339 PositionerUserTravelLimitsSet

Name

PositionerUserTravelLimitsSet – Sets the user travel limits.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner type (must not be a secondary positioner): (-8)
- Checks input parameter values: (-17)
  - UserMinimumTargetPosition < UserMaximumTargetPosition.
  - MinimumTargetPosition ≤ UserMinimumTargetPosition ≤ MaximumTargetPosition.
  - MinimumTargetPosition ≤ UserMaximumTargetPosition ≤ MaximumTargetPosition.
  - UserMinimumTargetPosition ≤ ProfilerPosition.
  - UserMaximumTargetPosition ≥ ProfilerPosition.
- If piezo driver, check if driver is not initialized: (-118)

Description

This function sets the new user travel limits of the selected positioner.

Prototype

```c
int PositionerUserTravelLimitsSet(  
    int SocketID,
    char * FullPositionerName,
    double UserMinimumTarget,
    double UserMaximumTarget
)
```

Input parameters

- SocketID: int Socket identifier gets by the “TCP_ConnectToServer” function.
- FullPositionerName: char * Positioner name.
- UserMinimumTarget: double User minimum travel limit (units).
- UserMaximumTarget: double User maximum travel limit (units).

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Wrong parameter type in the command string: double or double * expected.
- -118: Not allowed action driver not initialized.
7.2.1.340 PositionerWarningFollowingErrorGet [Extended]

Name
PositionerWarningFollowingErrorGet – Gets the warning following error for a positioner.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Invalid positioner name: (-18)

Description
This function gets the current value of the warning following error for a positioner.

Prototype
int PositionerWarningFollowingErrorGet(
    int SocketID,
    char * FullPositionerName,
    double * WarningFollowingError
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
FullPositionerName char * Positioner name.

Output parameters
WarningFollowingError double * Warning following error (units).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
7.2.1.341 **PositionerWarningFollowingErrorSet** [Extended]

**Name**

**PositionerWarningFollowingErrorSet** – Sets value of the warning following error for a positioner.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid object type: (-8)
- Checks input parameter values: (-17)
  - 0 < WarningFollowingError ≤ FatalFollowingError.
- Invalid positioner name: (-18)

**Description**

This function sets a new value of the warning following error for a positioner.

**Prototype**

```c
int PositionerWarningFollowingErrorSet(
    int SocketID,
    char * FullPositionerName,
    double WarningFollowingError
)
```

**Input parameters**

- **SocketID** int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **FullPositionerName** char *
  - Positioner name.
- **WarningFollowingError** double
  - Warning following error (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner name doesn't exist or unknown command.
7.2.1.342 Reboot

Name
Reboot – Reboots the controller.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function reboots the controller.

NOTE
This function is not a cold reboot (power off/on), it is a warm (soft) reboot.
If an FTP client is connected, this function is not allowed and (-22) error is returned.

Prototype
int Reboot(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the
        “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -22: Not allowed action.
### 7.2.1.343 RestartApplication

**Name**

`RestartApplication` – Restarts the controller’s application and avoids hardware reboot.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function allows restarting controller applications without hardware reboot.

**Prototype**

```c
int RestartApplication(int SocketID)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -22: Not allowed action.
7.2.1.344 SingleAxisSlaveModeDisable

Name
SingleAxisSlaveModeDisable – Disables the slave-master mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxis group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be "SLAVE": (-22)

Description
This function disables the master-slave mode. If a motion is in progress then it is aborted.
To use this function, the group state must be SLAVE (46). If it’s not the case then (-22) is returned.

Prototype
int SingleAxisSlaveModeDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int  Socket identifier gets by the "TCP_ConnectToServer" function.
GroupName char *  SingleAxis group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.345 SingleAxisSlaveModeEnable

Name
SingleAxisSlaveModeEnable – Enables the slave-master mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxis group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be “READY”: (-22)
- Checks the slave parameters (must be configured): (-41)

Description
This function enables the master-slave mode only if the slave group is in "READY" state. In this mode the slave must be defined as a SingleAxis group and the master can be a positioner from any group.

To use this function, the SingleAxis group must be in the READY state. If it’s not the case then (-22) error is returned.

To use this function, the master positioner and the slave ratio must be configured using the “SingleAxisSlaveParametersSet” function. If it’s not the case then (-41) error is returned.

Prototype
```c
int SingleAxisSlaveModeEnable(
    int SocketID,
    char * GroupName
)
```

Input parameters
- **SocketID**: int – Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * – SingleAxis group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-41**: Slave-master mode not configured.
7.2.1.346 SingleAxisSlaveParametersGet

**Name**

*SingleAxisSlaveParametersGet* – Gets the slave parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxis group): (-8)
- Checks the positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)

**Description**

This function returns the slave parameters: the master positioner name and the master-slave ratio.

**Prototype**

```c
int SingleAxisSlaveParametersGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    char * MasterPositionerName ,
    double * Ratio
)
```

**Input parameters**

- **SocketID** int 
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * 
  SingleAxis group name.

**Output parameters**

- **MasterPositionerName** char * 
  Master positioner name from any group.
- **Ratio** double * 
  Gear ratio between the master and the slave.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
- **-22:** Not allowed action.
7.2.1.347 **SingleAxisSlaveParametersSet**

### Name

**SingleAxisSlaveParametersSet** – Sets the slave parameters.

### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the master group type: (-8)
- Checks the ratio value (Ratio >0): (-17)
- Checks the master positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)
- Checks the base velocity value (must be null): (-48)

### Description

This function configures the slave parameters only for a SingleAxis group. The slave is a copy of the master and a ratio can be applied: Slave = Ratio * Master. The slave-master mode is activated only after the call of “SingleAxisSlaveModeEnable” function.

The master can be a positioner from any group, except from a spindle group. If the master group is a spindle then (-22) error is returned. The master positioner must be different from the slave positioner else (-8) error is returned.

---

**NOTE**

After an emergency stop, the master group and the slave group are in “NOTINIT” status. To restart a master-slave relation, the slave group(s) must be reinitialized before the master group.

### Prototype

```c
int SingleAxisSlaveParametersSet(  
    int SocketID,  
    char * GroupName,  
    int NbPositioners,  
    char * MasterPositionerName,  
    double Ratio  
)
```

### Input parameters

- **SocketID** (int) – Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** (char *) – SingleAxis group name.
- **MasterPositionerName** (char *) – Master positioner name from any group.
- **Ratio** (double) – Gear ratio between the master and the slave.

### Output parameters

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -48: BaseVelocity must be null.
7.2.1.348 SingleAxisThetaClampDisable [Extended]

Name
SingleAxisThetaClampDisable – unclamps a SingleAxisTheta group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
This function unclamps the selected SingleAxisTheta group
The group must be in the CLAMPED state. If unclamping is successful, the group is unclamped and the group state becomes “READY”.

Prototype
int SingleAxisThetaClampDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * SingleAxis group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.349 **SingleAxisThetaClampEnable** [Extended]

**Name**

*SingleAxisThetaClampEnable* – clamps a SingleAxisTheta group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

This function clamps the selected SingleAxisTheta group.

The group must be in the READY state. If clamping is successful, the group is clamped and the group state becomes “CLAMPED”.

**Prototype**

```c
int SingleAxisThetaClampEnable( 
    int SocketID, 
    char * GroupName 
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * SingleAxis group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
7.2.1.350 SingleAxisThetaFeedforwardJerkParametersGet
[Extended]

Name

SingleAxisThetaFeedforwardJerkParametersGet – Gets currently used “XY to Theta Feedforward Jerk” feature parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description

The “XY to Theta Feedforward Jerk” feature allows to compensate the vibration effect on the Theta stage when the XY stage speeds up or speeds down.

This function gets the currently used correction gains of “XY to Theta Feedforward Jerk” feature.

This API is reserved to SingleAxisTheta group only.

Prototype

int SingleAxisThetaFeedforwardJerkParametersGet(
    int SocketID,
    char GroupName[250],
    double * KFeedforwardJerkX,
    double * KFeedforwardJerkY
)

Input parameters

SocketID int Socket identifier gets by the _ConnectToServer” function.

GroupName char * Group name.

Output parameters

KFeedforwardJerkX double * X axis feedforward Jerk gain.
KFeedforwardJerkY double * Y axis feedforward Jerk gain.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -7: Wrong format in the command string.
- -8: Wrong object type for this command.
- -9: Wrong number of parameters in the command.
- -14: Wrong parameter type in the command string: double or double * expected.
- -19: GroupName doesn't exist or unknown command.
7.2.1.351 SingleAxisThetaFeedforwardJerkParametersSet  
[Extended]

**Name**

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**
The “XY to Theta Feedforward Jerk” feature allows to compensate the vibration effect on the Theta stage when the XY stage speeds up or speeds down.

This function configures the correction gains of “XY to Theta Feedforward Jerk” feature for the SingleAxisTheta group.

This API is reserved to SingleAxisTheta group only.

**Prototype**
```c
int SingleAxisThetaFeedforwardJerkParametersSet(  
    int SocketID,  
    char GroupName[250],  
    double KFeedforwardJerkX,  
    double KFeedforwardJerkY  
)
```

**Input parameters**
- **SocketID** int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *  
  SingleAxisTheta Group name.
- **KFeedforwardJerkX** double  
  X axis feedforward Jerk gain.
- **KFeedforwardJerkY** double  
  Y axis feedforward Jerk gain.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -7: Wrong format in the command string.
- -8: Wrong object type for this command.
- -9: Wrong number of parameters in the command.
- -14: Wrong parameter type in the command string: double or double * expected.
- -19: GroupName doesn't exist or unknown command.
7.2.1.352 SingleAxisThetaFeedforwardParametersGet

Name
SingleAxisThetaFeedforwardParametersGet – Gets currently used “XY to Theta Feedforward” feature parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description
The “XY to Theta Feedforward” feature allows to compensate the vibration effect on the Theta stage when the XY stage speeds up or speeds down.

This function gets the currently used correction gains of “XY to Theta Feedforward” feature.

This API is reserved to SingleAxisTheta group only.

Prototype
Int SingleAxisThetaFeedforwardParametersGet(
    int SocketID,
    char PositionerName[250],
    double * KFeedforwardX,
    double * KFeedforwardY
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
KFeedforwardX double * X axis feedforward gain.
KFeedforwardY double * Y axis feedforward gain.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.353 SingleAxisThetaFeedforwardParametersSet

[Extended]

Name
SingleAxisThetaFeedforwardParametersSet – Sets “XY to Theta Feedforward” feature parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description
The “XY to Theta Feedforward” feature allows to compensate the vibration effect on the Theta stage when the XY stage speeds up or slows down.
This function configures the correction gains of “XY to Theta Feedforward” feature for the SingleAxisTheta group.
This API is reserved to SingleAxisTheta group only.

Prototype
Int SingleAxisThetaFeedforwardParametersSet(
    int SocketID,
    char * PositionerName,
    double KFeedforwardX,
    double KFeedforwardY
)

Input parameters
SocketID       int       Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char *     Positioner name.
KFeedforwardX  double    X axis feedforward gain.
KFeedforwardY  double    Y axis feedforward gain.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.354 SingleAxisThetaSlaveModeDisable [Extended]

Name
SingleAxisThetaSlaveModeDisable – Disables the slave-master mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxisTheta group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be "SLAVE": (-22)

Description
This function disables the master-slave mode. If a motion is in progress then it is aborted.
To use this function, the group state must be SLAVE (46). If it is not the case then the (-22) error is returned.

Prototype
int SingleAxisThetaSlaveModeDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * SingleAxisTheta group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.355 SingleAxisThetaSlaveModeEnable [Extended]

Name
SingleAxisThetaSlaveModeEnable – Enables the slave-master mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxisTheta group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be “READY”: (-22)
- Checks the slave parameters (must be configured): (-41)

Description
This function enables the master-slave mode only if the slave group is in "READY" state. In this mode the slave must be defined as a SingleAxisTheta group and the master can be a positioner from any group.

To use this function, the SingleAxisTheta group must be in the READY state. If it’s not the case then (-22) error is returned.

To use this function, the master positioner and the slave ratio must be configured using the “SingleAxisThetaSlaveParametersSet” function. If it’s not the case then (-41) error is returned.

Prototype
int SingleAxisThetaSlaveModeEnable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * SingleAxisTheta group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -8: Wrong object type for this command.
• -18: Positioner Name doesn't exist or unknown command.
• -19: GroupName doesn't exist or unknown command.
• -22: Not allowed action.
• -41: Slave-master mode not configured.
7.2.1.356 SingleAxisThetaSlaveParametersGet [Extended]

Name
SingleAxisThetaSlaveParametersGet – Gets the slave parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a SingleAxisTheta group): (-8)
- Checks the positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)

Description
This function returns the slave parameters: the master positioner name and the master-slave ratio.

Prototype
int SingleAxisThetaSlaveParametersGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    char * MasterPositionerName ,
    double * Ratio
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * SingleAxisTheta group name.

Output parameters
MasterPositionerName char * Master positioner name from any group.
Ratio double * Gear ratio between the master and the slave.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.357 SingleAxisThetaSlaveParametersSet [Extended]

Name
SingleAxisThetaSlaveParametersSet – Sets the slave parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the master group type: (-8)
- Checks the ratio value (Ratio >0): (-17)
- Checks the master positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)
- Checks the base velocity value (must be null): (-48)

Description
This function configures the slave parameters only for a SingleAxisTheta group. The slave is a copy of the master and a ratio can be applied: Slave = Ratio * Master. The slave-master mode is activated only after the call of “SingleAxisThetaSlaveModeEnable” function. The master can be a positioner from any group, except from a spindle group. If the master group is a spindle then (-22) error is returned. The master positioner must be different from the slave positioner else (-8) error is returned.

NOTE
After an emergency stop, the master group and the slave group are in “NOTINIT” status. To restart a master-slave relation, the slave group(s) must be reinitialized before the master group.

Prototype
int SingleAxisThetaSlaveParametersSet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    char * MasterPositionerName ,
    double Ratio
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * SingleAxisTheta group name.
MasterPositionerName char * Master positioner name from any group.
Ratio double Gear ratio between the master and the slave.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -48: BaseVelocity must be null.
7.2.1.358 SpindleSlaveModeDisable

Name
SpindleSlaveModeDisable – Disables the slave-master mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a Spindle group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be "SLAVE": (-22)

Description
This function disables the master-slave mode for a spindle group. If a motion is in progress then it is aborted.
To use this function, the group state must be SLAVE (46). If it’s not the case then (-22) error is returned.

Prototype
int SpindleSlaveModeDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Spindle group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.359 **SpindleSlaveModeEnable**

**Name**

**SpindleSlaveModeEnable** – Enables the slave-master mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a Spindle group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be ”READY”: (-22)
- Checks the slave parameters (must be configured): (-41)

**Description**

This function enables the master-slave mode only if the slave group is in ready mode. In this mode the slave must be defined as a Spindle group and the master can be a positioner from any group.

To use this function, the Spindle group must be in the READY state. If it’s not the case then (-22) error is returned.

To use this function, the master positioner and the slave ratio must be configured with the “SpindleSlaveParametersSet” function. If it’s not the case then (-41) error is returned.

**Prototype**

```c
int SpindleSlaveModeEnable(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Spindle group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-41**: Slave-master mode not configured.
7.2.1.360 SpindleSlaveParametersGet

**Name**
SpindleSlaveParametersGet – Gets the spindle slave parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a Spindle group): (-8)
- Checks the positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)

**Description**
This function returns the slave parameters: the master positioner name and the master-slave ratio.

**Prototype**
```c
int SpindleSlaveParametersGet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    char * MasterPositionerName ,
    double * Ratio
)
```

**Input parameters**
- **SocketID**
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  Spindle group name.

**Output parameters**
- **MasterPositionerName**
  Master positioner name from any group.
- **Ratio**
  Gear ratio between the master and the slave.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.361 SpindleSlaveParametersSet

**Name**
SpindleSlaveParametersSet – Sets the spindle slave parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the master group type: (-8)
- Checks the ratio value (Ratio >0): (-17)
- Checks the master positioner name: (-18)
- Checks the slave parameters (must be configured): (-22)
- Checks the base velocity value (must be null): (-48)

**Description**
This function configures the slave parameters only for a Spindle group.
The slave is a master copy and a ratio can be applied: Slave = Ratio * Master.
The slave-master mode is activated only after calling of “SingleAxisSlaveModeEnable” function.
The master can be a positioner from a spindle group only. If the master group is another group type then (-22) error is returned. The master positioner must be different from the slave positioner else (-8) error is returned.

**NOTE**
After an emergency stop, the master group and the slave group are in “NOTINIT” state. To restart a master-slave relation, the slave group(s) must be reinitialized before the master group.

**Prototype**
```c
int SpindleSlaveParametersSet(
    int SocketID,
    char * GroupName,
    int NbPositioners,
    char * MasterPositionerName ,
    double * Ratio
)
```

**Input parameters**
- **SocketID**: int – Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * – Spindle group name.
- **MasterPositionerName**: char * – Master positioner name from any group.
- **Ratio**: double – Gear ratio between the master and the slave.

**Output parameters**
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -48: BaseVelocity must be null.
7.2.1.362 TCLScriptExecute

**Name**

**TCLScriptExecute** – Executes a TCL script.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks TCL file name: (-36)
- Checks TCL interpreter (task loading): (-37)
- Checks task name: (-47)

**Description**

This function executes a TCL script. The TCL script file must be saved in the folder “..\Public\Scripts” of the XPS controller.

- **TaskName** is a user designation for the TCL script being executed. If two TCL scripts are executed at the same time with the same task name, The (-47) error is returned because having the same TaskName is not allowed.
- **InputArguments** represents the input arguments of the TCL script to be executed. The number of these input arguments is not limited but the string length is limited to 250 characters. The argument separator is a comma. To redirect tcl “puts” function to putty instead of screen, you must specified “ttyp<number>” as first argument. Then specify the arguments that are useful for your script.

**WARNING :** The TCL script name must not contains a space.

**Prototype**

```c
int TCLScriptExecute(
    int SocketID,
    char * TCLFileName,
    char * TaskName,
    char * InputArguments
)
```

**Input parameters**

- **SocketID** int  Socket identifier gets by the “TCP_ConnectToServer” function.
- **TCLFileName** char *  File name contains the TCL script.
- **TaskName** char *  Task name.
- **InputArguments** char *  Input argument string (separator is a comma).

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-36:** Unknown TCL file.
- **-37:** TCL interpreter does not run.
-47:  
any space or tabulation.

Wrong TCL task name: each TCL task name must be different and doesn't contain
7.2.1.363 TCLScriptExecuteAndWait

**Name**
TCLScriptExecuteAndWait – Executes a TCL script and waits until the end of execution.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks TCL file name: (-36)
- Checks TCL interpreter (task loading): (-37)
- Checks task name: (-47)

**Description**
This function executes a TCL program. The “TCLScriptExecuteAndWait” function is different than the “TCLScriptExecute” function because it blocks the socket until the script terminates. The TCL script file must be saved in the folder “..\Public\Scripts” of the XPS controller. The file extension is “.tcl”.

- **TaskName** is a user designation for the TCL script in execution. If two TCL scripts are executed at the same time with the same task name, The (-47) error is returned because having the same TaskName is not allowed.
- **InputArguments** represents the input arguments of the TCL script to be executed. The number of these input arguments is not limited but the string length is limited to 250 characters. The argument separator is a comma.
- **OutputArguments** represents the output arguments of the TCL script to be executed. The number of these output arguments is not limited but the string length is limited to 250 characters. The argument separator is a comma.

**WARNING : The TCL script name must not contains a space.**

**Prototype**

```c
int TCLScriptExecuteAndWait(  
    int SocketID,  
    char * TCLFileName,  
    char * TaskName,  
    char * InputArguments,  
    char * OutputArguments  
)
```

**Input parameters**
- **SocketID** – int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **TCLFileName** – char *  
  File name contains the TCL script.
- **TaskName** – char *  
  Task name.
- **InputArguments** – char *  
  Input argument string (separator is a comma).

**Output parameters**
- **OutputArguments** – char *  
  Output argument string (separator is a comma).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -36: Unknown TCL file.
- -37: TCL interpreter doesn't run.
- -47: Wrong TCL task name: each TCL task name must be different and doesn't contain any space or tabulation.
7.2.1.364 TCLScriptExecuteWithPriority

Name
TCLScriptExecuteWithPriority – Executes a TCL script with TCL task given priority.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Priority mnemonic incorrect: (-17)
- Checks TCL file name: (-36)
- Checks TCL interpretor (task loading): (-37)
- Checks task name: (-47)

Description
This function executes a TCL script with a TCL task and a user-defined priority level. The TCL script file must be saved in the folder “../Public/Scripts” of the XPS controller.

TaskName is a user designation for the TCL script in execution. If two TCL scripts are executed at the same time with the same task name, The (-47) error is returned because having the same TaskName is not allowed.

InputArguments represents the input arguments to the TCL script to be executed. The number of these input arguments is not limited but the string length is limited to 250 characters. The argument separator is a comma.

PriorityLevel has three possible values: “HIGH”, “MEDIUM” and “LOW”, with the order being HIGH >MEDIUM >LOW.

WARNING : The TCL script name must not contains a space.

Prototype
int TCLScriptExecuteWithPriority(  
    int SocketID,  
    char * TCLFileName,  
    char * TaskName,  
    char * Priority,  
    char * InputArguments  
)  

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
TCLFileName char * File name contains the TCL script.
TaskName char * Task name.
Priority char * TCL task priority (HIGH, MEDIUM or LOW).
InputArguments char * Input argument string (separator is a comma).

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -17: Parameter out of range or incorrect.
• -36: Unknown TCL file.
• -37: TCL interpreter doesn't run.
• -47: Wrong TCL task name: each TCL task name must be different and doesn't contain any space or tabulation.
7.2.1.365 TCLScriptKill

**Name**

TCLScriptKill – Kills a TCL script.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks semaphore to use the TCL interpretor: (-37)
- Checks TCL interpretor (task loading) and task name: (-38)

**Description**

This function kills a running TCL script selected using its task name. The task name is a user designation for the TCL script in execution.

---

**NOTE**

For the boot script, the task name is “BootScript”.

---

**Prototype**

```c
int TCLScriptKill(
    int SocketID,
    char * TaskName
)
```

**Input parameters**

- **SocketID** (int): Socket identifier gets by the “TCP_ConnectToServer” function.
- **TaskName** (char *): Task name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -37: TCL interpretor doesn't run.
- -38: TCL script can not be killed: Wrong task name or task does not run.
- -47: Wrong TCL task name : each TCL task name must be different and doesn't contain any space or tabulation.
7.2.1.366 TCLScriptKillAll

**Name**
TCLScriptKillAll – Kills all running TCL scripts.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks TCL interpreter (task loading) and task name: (-38)

**Description**
This function kills all running TCL scripts.

**Prototype**

```c
int TCLScriptKillAll(
    int SocketID
)
```

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -38: TCL script can not be killed: Wrong task name or task does not run.
### 7.2.1.367 `TCLScriptRunningListGet`

**Name**

`TCLScriptRunningListGet`– Gets the list of all TCL processes in progress.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function returns the task name’s list of all TCL scripts in progression.

**Prototype**

```c
int TCLScriptRunningListGet(
    int SocketID,
    char * TCLScriptsList
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- `TCLScriptsList` char *: List of TCL scripts in progression.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.1.368 TCP_CloseSocket

Name
TCP_CloseSocket – Closes a socket.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks socket identifier (Max = 100).
- Socket must be used.

Description
Closed the opened TCP/IP communication defined by the given socket identifier. If the socket is undefined or is not used, then nothing happens.

Prototype
void TCP_CloseSocket(
    int SocketID
)

Input parameters
SocketID int Socket identifier used in each function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
None.
7.2.1.369 TCP_ConnectToServer

Name

TCP_ConnectToServer – Sets TCP/IP communication and opens a socket.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of used sockets (Max = 100): if no free socket then the SocketID is set to -1.

Description

Configures the TCP/IP communication and opens a socket to connect TCP server.

This function returns a socket identifier to use for each function call. The socket identifier is defined between 0 to 99. If the TCP/IP connection failed then the “SocketID” value is –1.

NOTE

OpenConnection function is used when users are in local mode, it only needs the timeout and socket number to open the connection with the XPS controller.

TCP_ConnectToServer function needs more information like the port number and the IP address. This function is called with the DLL.

Prototype

int TCP_ConnectToServer(
    char * IP_Address,
    int IP_Port,
    double TimeOut
)

Input parameters

IP_Address char * TCP IP address: 195.168.33.xxx or another.
IP_Port int TCP IP port: 5001 for XPS controller.
TimeOut double Timeout in seconds used for each.

function execution.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

SocketID int Socket identifier used in each function.
7.2.1.370 TCP_GetError

**Name**
TCP_GetError – Gets the last error about socket.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks socket identifier (Max = 100).
- Socket must be used.

**Description**
Gets the last error from the socket defined by the given socket identifier. If the socket is undefined or is not used, the error description is blank.

**Prototype**

```c
int TCP_GetError(  
    int SocketID,  
    char * ErrorString
)
```

**Input parameters**
SocketID int Socket identifier used in each function.

**Output parameters**
ErrorString char * Last error description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
None.
7.2.1.371 TCP_SetTimeout

**Name**
TCP_SetTimeout – Sets the timeout for TCP/IP communication.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks number of used sockets (Maximum number = 100).
- Socket must be used.
- Timeout value must be positive.

**Description**
Sets a new timeout value in seconds for the opened TCP/IP communication defined by a socket identifier.
If the timeout is less than 0.001, the timeout value defaults to 0.001.
If the socket is undefined or is not used then nothing happens.

**Prototype**
int TCP_SetTimeout(
        int SocketID,
        double Timeout
    )

**Input parameters**
SocketID int Socket identifier used in each function.
Timeout double Timeout in seconds used for each function execution.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
None.
7.2.1.372 TimerGet

Name
TimerGet – Gets the number of frequency ticks for the selected timer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function returns the number of frequency ticks configured for the selected timer.
The “TimerName” can be defined as:
- Timer1
- Timer2
- Timer3
- Timer4
- Timer5

The “FrequencyTicks” defines the frequency of the timer:
One frequency tick represents a corrector period = \( >0.125 \text{ ms} = >8 \text{ kHz} \)
N frequency ticks represents N corrector periods = \( >N \times 0.125 \text{ ms} = >\frac{8}{N} \text{ kHz} \)

NOTE
“FrequencyTicks” = 0 means that the timer is disabled.

Prototype
```c
int TimerGet(
    int SocketID,
    char * TimerName,
    int * FrequencyTicks
)
```

Input parameters
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **TimerName** char * Name of timer.

Output parameters
- **FrequencyTicks** int * Number of frequency ticks.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.1.373 TimerSet

Name
TimerSet – Sets the number of frequency ticks for the selected timer.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function sets the number of frequency ticks for the selected timer to activate it. The “TimerName” can be defined as:
• Timer1
• Timer2
• Timer3
• Timer4
• Timer5

The “FrequencyTicks” allows to defined the frequency of the timer:
One frequency tick represents a corrector period = >0.125 ms = >8 kHz
N frequency ticks represents N corrector periods = >N * 0.125 ms = >\frac{8}{N} kHz

NOTE
“FrequencyTicks” = 0 means that the timer is disabled.

Prototype
int TimerSet(
    int SocketID,
    char * TimerName,
    int FrequencyTicks
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
TimerName char * Name of timer.
FrequencyTicks int Number of frequency ticks.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
7.2.1.374 TZEncoderCouplingMatrixGet [Extended]

Name
TZEncoderCouplingMatrixGet – Gets TZ encoder coupling matrix parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description
This function gets the parameters of encoder coupling matrix for the TZ group.

TZ encoder coupling matrix:

\[
\begin{bmatrix}
  \text{Param1} & \text{Param2} & \text{Param3} \\
  \text{Param4} & \text{Param5} & \text{Param6} \\
  \text{Param7} & \text{Param8} & \text{Param9}
\end{bmatrix}
\]

This API is reserved to TZ group only.

Prototype

```c
int TZEncoderCouplingMatrixGet(
    int SocketID,
    char GroupName[250],
    double * Param1,
    double * Param2,
    double * Param3,
    double * Param4,
    double * Param5,
    double * Param6,
    double * Param7,
    double * Param8,
    double * Param9
)
```

Input parameters

- **SocketID** int 
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *
  Group name.
Output parameters

Param1: double * Encoder coupling matrix coefficient.
Param2: double * Encoder coupling matrix coefficient.
Param3: double * Encoder coupling matrix coefficient.
Param4: double * Encoder coupling matrix coefficient.
Param5: double * Encoder coupling matrix coefficient.
Param6: double * Encoder coupling matrix coefficient.
Param7: double * Encoder coupling matrix coefficient.
Param8: double * Encoder coupling matrix coefficient.
Param9: double * Encoder coupling matrix coefficient.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -19: GroupName doesn't exist or unknown command.
7.2.1.375 **TZEncoderCouplingMatrixSet [Extended]**

**Name**
TZEncoderCouplingMatrixSet – Sets TZ encoder coupling matrix parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**
This function configures the parameters of encoder coupling matrix for the TZ group. The values are set in the decoupling matrix in the following order:

\[
\begin{bmatrix}
\text{Param1} & \text{Param2} & \text{Param3} \\
\text{Param4} & \text{Param5} & \text{Param6} \\
\text{Param7} & \text{Param8} & \text{Param9}
\end{bmatrix}
\]

This API is reserved to TZ group only.

**Prototype**

```c
int TZEncoderCouplingMatrixSet(
    int SocketID,
    char GroupName[250],
    double Param1,
    double Param2,
    double Param3,
    double Param4,
    double Param5,
    double Param6,
    double Param7,
    double Param8,
    double Param9
)
```

**Input parameters**
- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.
- **Param1**: double Encoder coupling matrix coefficient.
- **Param2**: double Encoder coupling matrix coefficient.
- **Param3**: double Encoder coupling matrix coefficient.
- **Param4**: double Encoder coupling matrix coefficient.
- **Param5**: double Encoder coupling matrix coefficient.
- **Param6**: double Encoder coupling matrix coefficient.
- **Param7**: double Encoder coupling matrix coefficient.
- **Param8**: double Encoder coupling matrix coefficient.
- **Param9**: double Encoder coupling matrix coefficient.
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.376 TZEncoderCouplingModeGet [Extended]

Name
TZEncoderCouplingModeGet – Gets TZ encoder coupling mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description
This function gets the current state of encoder coupling mode (1=Enabled, 0=Disabled). This API is reserved to TZ group only.

Prototype
int TZEncoderCouplingModeGet(int SocketID, char GroupName[250], int * Mode)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
Mode int * Encoder coupling mode.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.377 TZEncoderCouplingModeSet [Extended]

**Name**
TZEncoderCouplingModeSet – Sets TZ encoder coupling mode.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**
This function configures the mode of encoder coupling.
The values for Mode to set are: 1 (Enabled) or 0 (Disabled).
This API is reserved to TZ group only.

**Prototype**
```
int TZEncoderCouplingModeSet(
    int SocketID,
    char GroupName[250],
    int Mode
)
```

**Input parameters**
- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *: Group name.
- **Mode** int: Encoder coupling mode.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.378 TZFocusModeDisable [Extended]

Name
TZFocusModeDisable – Disables the TZ group from out of the FOCUS state.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be “READY”: (-22)

Description
This function disables the FOCUS mode of a TZ group. If it executes the group quits FOCUS state and goes into READY state.
To use this function, The group must be in a FOCUS state. If not then (-22) error is returned.

Prototype
int TZFocusModeDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * TZ group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.379 TZFocusModeEnable [Extended]

**Name**
TZFocusModeEnable – Enables the TZ group to go in FOCUS state.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group state must be “READY”: (-22)

**Description**
This function enables the focus mode for the TZ group.
To use this function, the TZ group must be in READY state. If it’s not then (-22) error is returned.

**Prototype**
```c
int TZFocusModeEnable(
    int SocketID,
    char * GroupName
)
```

**Input parameters**
- SocketID: int Socket identifier gets by the “TCP_ConnectToServer” function.
- GroupName: char * TZ group name.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.380 TZMappingModeGet [Extended]

Name
TZMappingModeGet – Gets TZ mapping mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the group name: (-19)

Description
This function gets the current state of TZ mapping mode (1=Enabled, 0=Disabled). This API is reserved to TZ group only.

Prototype
int TZMappingModeGet(  
    int SocketID,  
    char * GroupName,  
    int * Mode  
)

Input parameters
SocketID  int  Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName  char *  TZ group name.

Output parameters
Mode  int *  TZ mapping mode state.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.381 TZMappingModeSet [Extended]

Name

TZMappingModeSet – Sets TZ mapping mode.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the group name: (-19)
- Checks if TZMapping feature is enabled in system.ini: (-121)
- Group state must be "NOTINIT": (-140)

Description

This function configures the mode of TZ mapping.

The values for Mode to set: 1 (Enabled) or 0 (Disabled).

This API is reserved to TZ group only.

Prototype

int TZMappingModeSet(  
   int SocketID,  
   char * GroupName,  
   int Mode  
)

Input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>TZ group name.</td>
</tr>
<tr>
<td>Mode</td>
<td>int</td>
<td>TZ mapping mode.</td>
</tr>
</tbody>
</table>

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
- -121: Function is not allowed due to configuration disabled.
- -140: Function is only allowed in NOTINIT state.
7.2.1.382 **TZMotorDecouplingMatrixGet [Extended]**

**Name**

**TZMotorDecouplingMatrixGet** – Gets TZ motor decoupling matrix parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**

This function gets the parameters of motor decoupling matrix for the TZ group.

TZ motor decoupling matrix:

\[
\begin{bmatrix}
\text{Param1} & \text{Param2} & \text{Param3} \\
\text{Param4} & \text{Param5} & \text{Param6} \\
\text{Param7} & \text{Param8} & \text{Param9}
\end{bmatrix}
\]

This API is reserved to TZ group only.

**Prototype**

```c
int TZMotorDecouplingMatrixGet(
    int SocketID,
    char GroupName[250],
    double * Param1,
    double * Param2,
    double * Param3,
    double * Param4,
    double * Param5,
    double * Param6,
    double * Param7,
    double * Param8,
    double * Param9
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *
  - Group name.
Output parameters

- **Param1**: double * Motor decoupling matrix coefficient.
- **Param2**: double * Motor decoupling matrix coefficient.
- **Param3**: double * Motor decoupling matrix coefficient.
- **Param4**: double * Motor decoupling matrix coefficient.
- **Param5**: double * Motor decoupling matrix coefficient.
- **Param6**: double * Motor decoupling matrix coefficient.
- **Param7**: double * Motor decoupling matrix coefficient.
- **Param8**: double * Motor decoupling matrix coefficient.
- **Param9**: double * Motor decoupling matrix coefficient.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -19: GroupName doesn't exist or unknown command.
7.2.1.383 TZMotorDecouplingMatrixSet [Extended]

**Name**
TZMotorDecouplingMatrixSet – Sets TZ motor decoupling matrix parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**
This function configures the parameters of motor decoupling matrix for the TZ group. The values are set in the decoupling matrix in the following order:

\[
\begin{bmatrix}
\text{Param1} & \text{Param2} & \text{Param3} \\
\text{Param4} & \text{Param5} & \text{Param6} \\
\text{Param7} & \text{Param8} & \text{Param9}
\end{bmatrix}
\]

This API is reserved to TZ group only.

**Prototype**

```c
int TZMotorDecouplingMatrixSet(
    int SocketID,
    char GroupName[250],
    double Param1,
    double Param2,
    double Param3,
    double Param4,
    double Param5,
    double Param6,
    double Param7,
    double Param8,
    double Param9
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>Param1</td>
<td>double</td>
<td>Motor decoupling matrix coefficient.</td>

<td>Motor decoupling matrix coefficient.</td>
</tr>
<tr>
<td>Param8</td>
<td>double</td>
<td>Motor decoupling matrix coefficient.</td>
</tr>
<tr>
<td>Param9</td>
<td>double</td>
<td>Motor decoupling matrix coefficient.</td>
</tr>
</tbody>
</table>
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.384 TZMotorDecouplingModeGet [Extended]

Name
TZMotorDecouplingModeGet – Gets TZ motor decoupling mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

Description
This function gets the current state of motor decoupling mode (1=Enabled, 0=Disabled). This API is reserved to TZ group only.

Prototype
int TZMotorDecouplingModeGet(
    int SocketID,
    char GroupName[250],
    int * Mode
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
Mode int * Motor decoupling mode.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: GroupName doesn’t exist or unknown command.
7.2.1.385 **TZMotorDecouplingModeSet** [Extended]

**Name**
TZMotorDecouplingModeSet – Sets TZ motor decoupling mode.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group name: (-19)

**Description**
This function configures the mode of motor decoupling.
The values for Mode to set are: 1 (Enabled) or 0 (Disabled).
This API is reserved to TZ group only.

**Prototype**
```c
int TZMotorDecouplingModeSet(
    int SocketID,
    char GroupName[250],
    int Mode
);
```

**Input parameters**
- **SocketID**: int, Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *, Group name.
- **Mode**: int, Motor decoupling mode.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: GroupName doesn't exist or unknown command.
7.2.1.386 **TZPTExecution [Extended]**

**Name**

TZPTExecution – Executes a PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a TZ group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)

**Description**

This function executes a PT (Position Time) trajectory. The trajectory file must be stored in the folder “\Admin\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned. Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “TZPTVerification” and “TZPTVerificationResultGet” functions. During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

**NOTE**

In case of an (-33) error, an (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

This function can be used only with the XPS-Q Precision Platform controller.

**Prototype**

```c
int TZPTExecution(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    int ExecutionNumber
)
```
**Input parameters**

- **SocketID**: int
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**: char *
  Group name.

- **FileName**: char *
  Trajectory file name.

- **ExecutionNumber**: int
  Number of trajectory executions.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:
  No error.

- -3:
  String too long.

- -8:
  Wrong object type for this command.

- -17:
  Parameter out of range or incorrect.

- -19:
  Group name doesn't exist or unknown command.

- -22:
  Not allowed action.

- -24:
  Not available in this configuration.

- -25:
  Following Error.

- -33:
  Motion done timeout.

- -44:
  Slave error disabling master.

- -46:
  Not allowed action due to backlash.

- -48:
  BaseVelocity must be null.

- -61:
  Error file corrupt or file doesn't exist.

- -71:
  Error read from or write in message queue.

- -72:
  Error trajectory initialization.
7.2.1.387 TZPTLoadToMemory [Extended]

Name
TZPTLoadToMemory – Loads some lines of PT trajectory to the controller memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and ≤400): (-3) or (-17)
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function loads some lines of PT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “,” “;” and “n” two successive characters). To verify or to execute the PT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

NOTE
All of the PT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PT trajectory in RAM as it does from a disk.

Example:
TZPTLoadToMemory(socketId,myGroup,"dT1,dX11,dX12,dX13#…dTn,dXn1,dXn2,dXn3#")
TZPTVerification (socketId,myGroup,FromMemory)
TZPTExecution(socketId,myGroup,FromMemory,1).

Prototype
int TZPTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char TrajectoryData[400]
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
TrajectoryData char * Trajectory data lines.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.388 TZPTParametersGet [Extended]

Name
TZPTParametersGet – Gets PT trajectory parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PT): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the PT trajectory parameters (trajectory name and current executing element number) of the current PT trajectory.

Prototype
int TZPTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
FileName char * Currently executing trajectory file name.
CurrentElementNumber int * Currently executing element number.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
• -19: Group name doesn't exist or unknown command.
• -22: Not allowed action.
• -24: Not available in this configuration.
7.2.1.389 **TZPTPulseOutputGet [Extended]**

**Name**

TZPTPulseOutputGet – Gets the configuration of pulse generation of a PT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function returns the last configuration of pulse generation of a PT trajectory, that was previously set by `TZPTPulseOutputSet()`.

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

**Example:**

TZPTPulseOutputSet(MyGroup, 3, 5, 0.01)

TZPTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is error return, means OK)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

Start element = 3
End element = 5
Time interval = 0.01 seconds.

**Prototype**

```c
int TZPTPulseOutputGet(  
    int SocketID,  
    char GroupName[250],  
    int * StartElement,  
    int * EndElement,  
    double * TimeInterval  
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StartElement</td>
<td>int *</td>
<td>Start pulse element number.</td>
</tr>
<tr>
<td>EndElement</td>
<td>int *</td>
<td>End pulse element number.</td>
</tr>
<tr>
<td>TimeInterval</td>
<td>double*</td>
<td>Time interval between pulses (seconds).</td>
</tr>
</tbody>
</table>
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
- -24: Not available in this configuration.
7.2.1.390 TZPTPulseOutputSet [Extended]

Name
TZPTPulseOutputSet – Sets the configuration of pulse generation of a PT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function configures and activates the pulse generation of a PT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PT trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PT trajectory. The pulses are generated between the first and the last trajectory element. The minimum possible time interval is CorrectorISRPeriod value (system.ref).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

Example:
TZPTPulseOutputSet(Group1, 3, 5, 0.01)
One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

Prototype
int TZPTPulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
**Input parameters**

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char * Group name.

StartElement int Start pulse element number.

EndElement int End pulse element number.

TimeInterval double Time interval between pulses (seconds).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
### 7.2.1.391 TZPTResetInMemory [Extended]

#### Name

**TZPTResetInMemory** – Deletes the content of the PT trajectory buffer in the controller memory.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

#### Description

This function deletes the PT trajectory buffer in the controller memory, that was previously loaded with the “TZPTLoadToMemory” function.

#### Prototype

```c
int TZPTResetInMemory(
    int SocketID,
    char GroupName[250]
)
```

#### Input parameters

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

#### Output parameters

None.

#### Return

(In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0**: No error.
- **-3**: String too long.
- **-8**: Wrong object type for this command.
- **-19**: Group name doesn't exist or unknown command.
- **-24**: Not available in this configuration.
7.2.1.392 **TZPTVerification** [Extended]

**Name**
TZPTVerification – Checks a PT trajectory data file.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must \( \leq 250 \))\): (-3)
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory (number of elements must >0): (-66)
- Checks velocity (Minimum Velocity \( \leq \) Velocity \( \leq \) Maximum Velocity): (-68)
- Checks acceleration (Minimum acc. \( \leq \) acceleration \( \leq \) Maximum acc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

**Description**
This function verifies the execution of a PT trajectory. The results of the verification can be got with the “TZPTVerificationResultGet” function. The trajectory file must be stored in the folder “\ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:
- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a PT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

**NOTE**
Because of the PT trajectory algorithm for elements end velocity calculation, a correct PT trajectory file must have at least two lines with zero displacements at the trajectory end. Otherwise, the “TZPTVerification” function returns the (-70) error.

The “TZPTVerification” function is independent from the “TZPTExecution” function, but it is highly recommended to execute this function before executing a PT trajectory.

**Prototype**

```c
int TZPTVerification()
```
int SocketID,
    char GroupName[250],
    char FileName[250]
)

**Input parameters**

SocketID  int  Socket identifier gets by the
           “TCP_ConnectToServer” function.
GroupName  char *  Group name.
FileName   char *  Trajectory file name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
- -61: Error file corrupt or file doesn't exist.
- -66: Trajectory doesn't contain any element.
- -68: Acceleration on trajectory is too big.
- -69: Acceleration on trajectory is too big.
- -70: Final velocity on trajectory is not zero.
- -72: Error trajectory initialization.
- -75: Trajectory element has a negative or null delta T.
7.2.1.393 TZPTVerificationResultGet [Extended]

**Name**
TZPTVerificationResultGet – Gets the results of the “TZPTVerification” function.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last TZ PTVerification (must be done): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**
This function returns the results of the previous “TZPTVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

**Prototype**

```c
int TZPTVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**
- **TrajectoryFileName** char * Examined trajectory file name.
- **MinimumPosition** double * Minimum position (units).
- **MaximumPosition** double * Maximum position (units).
- **MaximumVelocity** double * Maximum velocity (units/s).
- **MaximumAcceleration** double * Maximum acceleration (units/s²).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
7.2.1.394 TZPVTExecution [Extended]

Name
TZPVTExecution – Executes a PVT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a TZ group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)

Description
This function executes a PVT (Position Velocity Time) trajectory. The trajectory file must be stored in the folder “\Admin\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned.
Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “TZPVTVerification” and “TZPVTVerificationResultGet” functions.
During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

NOTES
In case of (-33) error, (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int TZPVTExecution(
    int SocketID,
    charGroupName[250],
    char FileName[250],
    int ExecutionNumber
)
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>FileName</td>
<td>char *</td>
<td>Trajectory file name.</td>
</tr>
<tr>
<td>ExecutionNumber</td>
<td>int</td>
<td>Number of trajectory executions.</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
- -25: Following Error.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.395 **TZPVTLoadToMemory [Extended]**

**Name**

TZPVTLoadToMemory – Load some lines of PVT trajectory to the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and ≤400): (-3) or (-17)
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function loads some lines of PVT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “।” and “” two successive characters). To verify or to execute the PVT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

**NOTES**

All of the PVT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PVT trajectory in RAM as it does from a disk.

**Example:**

```
TZPVTLoadToMemory(socketId,myGroup,"dT1,dX11,Vout11,dX12,Vout12,
                  dX13,Vout13#...dTn,dXn1,Voutn1,dXn2,Voutn2, dXn3,Voutn3#")
TZPVTVerification (socketId,myGroup,FromMemory)
TZPVTExecution(socketId,myGroup,FromMemory,1).
```

**Prototype**

```
int TZPVTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    char TrajectoryData[400]
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.
- **TrajectoryData**
  - char *
  - Trajectory data lines.

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.396 **TZPVTParametersGet** [Extended]

**Name**
TZPVTParametersGet – Gets PVT trajectory parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PVT): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**
This function returns the PVT trajectory parameters (trajectory name and current executing element number) of the current PVT trajectory.

**Prototype**
```
int TZPVTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
)
```

**Input parameters**
- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.

**Output parameters**
- **FileName**: char * Currently executing trajectory file name.
- **CurrentElementNumber**: int * Currently executing element number.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: Group name doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-24**: Not available in this configuration.
7.2.1.397 TZPVTPulseOutputGet [Extended]

Name
TZPVTPulseOutputGet – Gets the configuration of pulse generation of a PVT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the last configuration of pulse generation of a PVT trajectory, that was previously set by TZPVTPulseOutputSet().

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

Example:
TZPVTPulseOutputSet(MyGroup, 3, 5, 0.01)
TZPVTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is error return, means OK)
One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.
Start element = 3
End element = 5
Time interval = 0.01 seconds.

Prototype
int TZPVTPulseOutputGet(
    int SocketID,
    char GroupName[250],
    int * StartElement,
    int * EndElement,
    double * TimeInterval
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
StartElement int * Start pulse element number.
EndElement int * End pulse element number.
TimeInterval double * Time interval between pulses (seconds).
**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
- -24: Not available in this configuration.
7.2.1.398 TZPVTPulseOutputSet [Extended]

Name
TZPVTPulseOutputSet – Sets the configuration of pulse generation of a PVT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function configures and activates the pulse generation of a PVT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PVT trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PVT trajectory. The pulses are generated between the first and the last trajectory element. The minimum possible time interval is CorrectorISRPeriod value (system.ref).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Puleses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual, Appendix / General I/O Description.

Example:
TZPVTPulseOutputSet(Group1, 3, 5, 0.01)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

Prototype
int TZPVTPulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
**Input parameters**

- **SocketID**  
  *int*  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**  
  *char* * *  
  Group name.

- **StartElement**  
  *int*  
  Start pulse element number.

- **EndElement**  
  *int*  
  End pulse element number.

- **TimeInterval**  
  *double*  
  Time interval between pulses (seconds).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:**  
  No error.

- **-8:**  
  Wrong object type for this command.

- **-19:**  
  Group name doesn’t exist or unknown command.

- **-22:**  
  Not allowed action.

- **-24:**  
  Not available in this configuration.
### 7.2.1.399 TZPVTResetInMemory [Extended]

#### Name
TZPVTResetInMemory – Deletes the content of the PVT trajectory buffer in the controller memory.

#### Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

#### Description
This function deletes the PVT trajectory buffer in the controller memory, that was previously loaded with the “TZPVTLoadToMemory” function.

#### Prototype
```c
int TZPVTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    char TrajectoryData[400]
)
```

#### Input parameters
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **FileName** char * Trajectory file name.
- **TrajectoryData** char * Trajectory data lines.

#### Output parameters
None.

#### Return
(In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-3**: String too long.
- **-8**: Wrong object type for this command.
- **-19**: Group name doesn't exist or unknown command.
- **-24**: Not available in this configuration.
7.2.1.400 TZPVTVerification [Extended]

Name
TZPVTVerification – Checks a PVT trajectory data file.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤250): (-3)
- Checks group type (must be a TZ group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory file (number of elements must >0): (-66)
- Checks velocity (MinimumVelocity ≤ Velocity ≤ MaximumVelocity): (-68)
- Checks acceleration (MinimumAcc. ≤ acceleration ≤ MaximumAcc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

Description
This function verifies the execution of a PVT trajectory. The results of the verification can be got with the “TZPVTVerificationResultGet” function. The trajectory file must be stored in the folder “\ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:
- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a PVT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

NOTES
The “TZPVTVerification” function is independent from the “TZPVTExecution” function, but it is highly recommended to execute this function before executing a PVT trajectory.

This function can be used only with the XPS-Q Precision Platform controller.
Prototype

int TZPVTVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)

Input parameters

SocketID       int       Socket identifier gets by the
                 “TCP_ConnectToServer” function.
GroupName      char *    Group name.
FileName       char *    Trajectory file name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
- -61: Error file corrupt or file doesn't exist.
- -66: Trajectory doesn't content any element.
- -68: Acceleration on trajectory is too big.
- -69: Acceleration on trajectory is too big.
- -70: Final velocity on trajectory is not zero.
- -72: Error trajectory initialization.
- -75: Trajectory element has a negative or null delta T.
7.2.1.401 TZPVTVerificationResultGet [Extended]

Name
TZPVTVerificationResultGet – Gets the results of the “TZPVTVerification” function.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250); (-3)
- Checks positioner name: (-18)
- Checks the last TZ PVTVerification (must be done): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the results of the previous “TZPVTVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

Prototype
int TZPVTVerificationResultGet(
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
TrajectoryFileName char * Examined trajectory file name.
MinimumPosition double * Minimum position (units).
MaximumPosition double * Maximum position (units).
MaximumVelocity double * Maximum velocity (units/s).
MaximumAcceleration double * Maximum acceleration (units/s²).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
7.2.1.402 TZTrackingCutOffFrequencyGet [Extended]

Name
TZTrackingCutOffFrequencyGet – Gets tracking cut-off frequency of TZ group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the group (must not be a positioner): (-19)

Description
This function gets the tracking cut-off frequency of each positioner of TZ group.

Prototype
int TZTrackingCutOffFrequencyGet(
    int SocketID,
    char * GroupName,
    double * CutOffFrequency1,
    double * CutOffFrequency2,
    double * CutOffFrequency3
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function
GroupName char * TZ group name

Output parameters
CutOffFrequency1 double * Positioner 1 cut-off frequency (Hz)
CutOffFrequency2 double * Positioner 2 cut-off frequency (Hz)
CutOffFrequency3 double * Positioner 3 cut-off frequency (Hz)

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
• -19: Group name doesn't exist or unknown command.
7.2.1.403 TZTrackingCutOffFrequencySet [Extended]

Name
TZTrackingCutOffFrequencySet – Sets tracking cut-off frequency of TZ group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Value is out of range: (-17)
- Checks the group (must not be a positioner): (-19)

Description
This function sets the tracking cut-off frequency for each positioner of TZ group.

Prototype
int TZTrackingCutOffFrequencySet(
    int SocketID,
    char * GroupName,
    double CutOffFrequency1,
    double CutOffFrequency2,
    double CutOffFrequency3
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function
GroupName char * TZ group name
CutOffFrequency1 double Positioner 1 cut-off frequency (Hz)
CutOffFrequency2 double Positioner 2 cut-off frequency (Hz)
CutOffFrequency3 double Positioner 3 cut-off frequency (Hz)

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
7.2.1.404 TZTrackingUserMaximumZZZTargetDifferenceGet [Extended]

**Name**

TZTrackingUserMaximumZZZTargetDifferenceGet – Gets tracking maximum ZZZ target difference of TZ group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Checks the group (must not be a positioner): (-19)

**Description**

This function gets the tracking maximum ZZZ target difference of TZ group.

**Prototype**

```c
int TZTrackingUserMaximumZZZTargetDifferenceGet(  
    int SocketID,  
    char * GroupName,  
    double * UserMaximumZZZTargetDifference  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * TZ group name.

**Output parameters**

- **UserMaximumZZZTargetDifference** double * User maximum ZZZ target difference (units).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0 : No error.
- -8 : Wrong object type for this command.
- -19 : Group name doesn't exist or unknown command.
7.2.1.405 TZTrackingUserMaximumZZZTargetDifferenceSet
[Extended]

**Name**
TZTrackingUserMaximumZZZTargetDifferenceSet – Sets tracking maximum ZZZ target difference for a TZ group.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the group type (must be a TZ group): (-8)
- Value is out of range: (-17)
- Checks the group (must not be a positioner): (-19)

**Description**
This function sets the tracking maximum ZZZ target difference for a TZ group.

**Prototype**
```c
int TZTrackingUserMaximumZZZTargetDifferenceSet(
    int SocketID,
    char * GroupName,
    double * UserMaximumZZZTargetDifference
)
```

**Input parameters**
- **SocketID**
  int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  char *
  TZ group name.
- **UserMaximumZZZTargetDifference**
  double
  User maximum ZZZ target difference (units).

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0:**
  No error.
- **-8:**
  Wrong object type for this command.
- **-17:**
  Parameter out of range or incorrect.
- **-19:**
  GroupName doesn't exist or unknown command.
7.2.1.406 XYCrossTalkCompensationMotorDecouplingGet [Extended]

Name

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the cross talk compensation switch is disabled (firmware.ref): (-121).

Description

This function returns the motor decoupling parameters of XY cross talk compensation.

Prototype

```c
int XYCrossTalkCompensationMotorDecouplingGet(
    int SocketID,
    char *GroupName,
    int *CrossTalkCompensationMode,
    double *YToX1FFAccRatio,
    double *YToX2FFAccRatio,
    double *X1ToYFFAccRatio,
    double *X2ToYFFAccRatio
)
```

Input parameters

- **SocketID** int - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * - Group name.

Output parameters

- **CrossTalkCompensationMode** int * - XY cross talk compensation mode (Enabled or Disabled)
- **YToX1FFAccRatio** double * - Current Y to X1 feed forward acceleration ratio
- **YToX2FFAccRatio** double * - Current Y to X2 feed forward acceleration ratio
- **X1ToYFFAccRatio** double * - Current X1 to Y feed forward acceleration ratio
- **X2ToYFFAccRatio** double * - Current X2 to Y feed forward acceleration ratio

Return

(In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -121: Function is not allowed due to configuration disabled
7.2.1.407 XYCrossTalkCompensationMotorDecouplingSet

[Extended]

Name

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the cross talk compensation switch is disabled (*firmware.ref*): (-121).
- Checks if the group is not in NOTINIT nor in DISABLE state: (-215).

Description

This function sets the motor decoupling parameters of XY cross talk compensation.

Prototype

```c
int XYCrossTalkCompensationMotorDecouplingSet(
    int SocketID,
    char *GroupName,
    int CrossTalkCompensationMode,
    double YToX1FFAccRatio,
    double YToX2FFAccRatio,
    double X1ToYFFAccRatio,
    double X2ToYFFAccRatio
)
```

Input parameters

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char * Group name.
- **CrossTalkCompensationMode**: int XY cross talk compensation mode (Enabled or Disabled)
- **YToX1FFAccRatio**: double Current Y to X1 feed forward acceleration ratio
- **YToX2FFAccRatio**: double Current Y to X2 feed forward acceleration ratio
- **X1ToYFFAccRatio**: double Current X1 to Y feed forward acceleration ratio
- **X2ToYFFAccRatio**: double Current X2 to Y feed forward acceleration ratio

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-121**: Function is not allowed due to configuration disabled
- **-215**: Not allowed action because group is not in NOTINIT nor in DISABLE state.
7.2.1.408 XYGroupPositionCorrectedProfilerGet

**Name**

*XYGroupPositionCorrectedProfilerGet* – Gets the corrected profiler position for all positioners of an XY group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid object type: (-8)
- Valid group type (must be an XY group): (-18)
- Invalid group name: (-19)

**Description**

This function gets the corrected position which is the theoretical position recalculated with the XY mapping correction.

This function applies the XY mapping on the theoretical user-defined positions and returns the corrected positions.

**Prototype**

```c
int XYGroupPositionCorrectedProfilerGet(
    int SocketID,
    char * GroupName,
    double PositionX,
    double PositionY,
    double * CorrectedPositionX,
    double * CorrectedPositionY
)
```
**Input parameters**

- **SocketID**
  - Type: int
  - Description: Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**
  - Type: char *
  - Description: Group name.

- **PositionX**
  - Type: double
  - Description: Theoretical position X.

- **PositionY**
  - Type: double
  - Description: Theoretical position Y.

**Output parameters**

- **CorrectedPositionX**
  - Type: double *
  - Description: Corrected theoretical position X.

- **CorrectedPositionY**
  - Type: double *
  - Description: Corrected theoretical position Y.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-18:** Positioner Name doesn't exist or unknown command.
- **-19:** GroupName doesn't exist or unknown command.
7.2.1.409 XYGroupPositionPCORawEncoderGet

Name

XYGroupPositionPCORawEncoderGet – Gets the PCO raw encoder positions for an XY group.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valid object type: (-8)
- Valid group type (must be an XY group): (-18)
- Invalid group name: (-19)

Description

This function returns the PCO raw encoder positions X and Y from the user specified positions X and Y.

Prototype

```c
int XYGroupPositionPCORawEncoderGet(
    int SocketID,
    char * GroupName,
    double PositionX,
    double PositionY,
    double * PCORawPositionX,
    double * PCORawPositionY
)
```

Input parameters

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *: Group name.
- **PositionX** double: User corrected position X.
- **PositionY** double: User corrected position Y.

Output parameters

- **PCORawPositionX** double *: PCO Raw position X.
- **PCORawPositionY** double *: PCO Raw position Y.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.410 XYLineArcExecution

Name

XYLineArcExecution – Executes a LineArc trajectory.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a XY group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks input value (Velocity and Acceleration >0): (-17)
- Checks group name: (-19)
- Group state must be “READY”: (-22)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks the velocity (Velocity must ≤ TrajectoryMaximumVelocity): (-68)
- Checks the acceleration (Acceleration must ≤ TrajectoryMaximumAcceleration): (-69)
- Checks message queue: (-71)

Description

This function executes a LineArc trajectory. The trajectory file must be stored in the folder “\Admin\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned.

Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “XYLineArcVerification” and “XYLineArcVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

NOTE

In case of (-33) error, (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype

int XYLineArcExecution(  
    int SocketID,  
    char GroupName[250],  
    char FileName[250],  
    double Velocity,  
    double Acceleration,  
    int ExecutionNumber  
)
Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
FileName char * Trajectory file name.
Velocity double Trajectory velocity (units/s).
Acceleration double Trajectory acceleration (units/s²).
ExecutionNumber int Number of trajectory executions.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -3: String too long.
• -8: Wrong object type for this command.
• -17: Parameter out of range or incorrect.
• -19: Group name doesn't exist or unknown command.
• -22: Not allowed action.
• -25: Following Error.
• -33: Motion done timeout.
• -44: Slave error disabling master.
• -46: Not allowed action due to backlash.
• -48: BaseVelocity must be null.
• -61: Error file corrupt or file doesn't exist.
• -68: Velocity on trajectory is too big.
• -69: Acceleration on trajectory is too big.
• -71: Error read from or write in message queue.
• -72: Error trajectory initialization.
7.2.1.411 XYLineArcParametersGet

Name
XYLineArcParametersGet – Gets LineArc trajectory parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be LineArc): (-22)

Description
This function returns the LineArc trajectory parameters (trajectory name, trajectory velocity, trajectory acceleration, current executing element number) of the current LineArc trajectory.

Prototype
int XYLineArcParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    double * Velocity,
    double * Acceleration,
    int * CurrentElementNumber
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
FileName char * Currently executing trajectory file name.
Velocity double * Trajectory velocity (units/s).
Acceleration double * Trajectory acceleration (units/s²).
CurrentElementNumber int * Currently executing element number.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
• -19: Group name doesn’t exist or unknown command.
• -22: Not allowed action.
7.2.1.412 **XYLineArcPulseOutputGet**

**Name**

*XYLineArcPulseOutputGet* – Gets the configuration of pulse generation of a LineArc.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)

**Description**

This function returns the last configuration of pulse generation of a LineArc trajectory, that was previously set by *XYLineArcPulseOutputSet()*. The pulse output configuration is defined by a pulse start trajectory curved length, a pulse end trajectory curved length, and a pulse trajectory curved length interval.

*Example:*

```c
XYLineArcPulseOutputSet(MyGroup, 10, 30, 0.01)
XYLineArcPulseOutputGet(MyGroup) => 0,10,30,0.01 (0 is error return, means OK)
```

One pulse will be generated every 10 μm on the LineArc trajectory between 10 mm and 30 mm trajectory curved lengths.

- Pulse start trajectory curved length = 10 mm
- Pulse end trajectory curved length = 30 mm
- Pulse trajectory curved length interval = 0.01 mm.

**Prototype**

```c
int XYLineArcPulseOutputGet(
    int SocketID,
    char GroupName[250],
    double * StartLength,
    double * EndLength,
    double * PathLengthInterval
)
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

**Output parameters**

- **StartLength**
  - double *
  - Pulse start length (units).
- **EndLength**
  - double *
  - Pulse end length (units).
- **PathLengthInterval**
  - double *
  - Pulse length interval (units).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
7.2.1.413 XYLineArcPulseOutputSet

**Name**

XYLineArcPulseOutputSet – Sets the configuration of pulse generation of a LineArc trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Controller initialization failed: (-20)
- Checks the pulse generation must not be in progress: (-22)

**Description**

This function configures and activates the pulse generation of a LineArc trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected LineArc trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows to generate pulses at constant pulse trajectory curved length intervals on a LineArc trajectory. The pulses are generated between a pulse start trajectory curved length and a pulse end trajectory curved length. All lengths are calculated in an orthogonal XY coordination system.

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual, Appendix / General I/O Description.

**Example:**

XYLineArcPulseOutputSet(Group1, 10, 30, 0.01)

One pulse will be generated every 10 μm on the LineArc trajectory between 10 mm and 30 mm trajectory curved lengths.

- Pulse start trajectory curved length = 10 mm
- Pulse end trajectory curved length = 30 mm
- Pulse trajectory curved length interval = 0.01 mm
**Prototype**

```c
int XYLineArcPulseOutputSet(
    int SocketID,
    char GroupName[250],
    double StartLength,
    double EndLength,
    double PathLengthInterval
)
```

**Input parameters**

- **SocketID** int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *  
  Group name.
- **StartLength** double  
  Pulse start length (units).
- **EndLength** double  
  Pulse end length (units).
- **PathLengthInterval** double  
  Pulse length interval (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**:  
  No error.
- **-8**:  
  Wrong object type for this command.
- **-19**:  
  Group name doesn't exist or unknown command.
- **-22**:  
  Not allowed action.
7.2.1.414 XYLineArcVerification

Name

XYLineArcVerification – Checks a LineArc trajectory data file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤250): (-3)
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory element (Radius ≥1e-14): (-63)
- Checks trajectory element (SweepAngle ≥1e-14): (-64)
- Checks trajectory element ([XElementDistance | ≥1e-14, | YElementDistance | ≥1e-14, TangentOut ≠ 1.797e308): (-65)
- Checks trajectory element (number of elements must ≥0): (-66)
- Checks keys (“FirstTangent” and “DiscontinuityAngle”) in trajectory file: (-74)

Description

This function verifies the execution of a LineArc trajectory. The results of the verification can be got with the “XYLineArcVerificationResultGet” function. The trajectory file must be stored in the folder “\ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:

• Checks the trajectory file for data coherence.
• Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
• The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a LineArc trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
• If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

NOTE

The “XYLineArcVerification” function is independent from the “XYLineArcExecution” function, but it is highly recommended to execute this function before executing a LineArc trajectory.
Prototype

```c
int XYLineArcVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)
```

**Input parameters**

- **SocketID**
  - `int`
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - `char *`
  - Group name.
- **FileName**
  - `char *`
  -Trajectory file name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -61: Error file corrupt or file doesn't exist.
- -63: Wrong XY trajectory element arc radius.
- -64: Wrong XY trajectory element sweep angle.
- -65: Trajectory line element discontinuity error or new element is too small.
- -66: Trajectory doesn't contain any element.
- -72: Error trajectory initialization.
- -74: Error file parameter key not found.
7.2.1.415 XYLineArcVerificationResultGet

**Name**

XYLineArcVerificationResultGet – Gets the results of the “XYLineArcVerification” function.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last XY LineArcVerification (must be done): (-22)

**Description**

This function returns the results of the previous “XYLineArcVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

**Prototype**

```c
int XYLineArcVerificationResultGet(
    SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

**Output parameters**

- **TrajectoryFileName** char * Examined trajectory file name.
- **MinimumPosition** double * Minimum position (units).
- **MaximumPosition** double * Maximum position (units).
- **MaximumVelocity** double * Maximum velocity (units/s).
- **MaximumAcceleration** double * Maximum acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.416 XYDualCorrectorMappingGet [Extended]

**Name**

*XYDualCorrectorMappingGet* – Read data of a line of an XY dual corrector mapping matrix in the controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Check DualCorrectorSwitch (firmware.ref, must be Enabled): (-121)
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 2 and ≤ MappingColumnNumber+2): (-9)
- Checks mapping enable state (must be Enabled): (-121)

**Description**

Read data of a line of a XY dual corrector mapping matrix in the controller.

**Example:**

```
0  -3.00  -2.00  -1.00  0.00  1.00  2.00  3.00
-3.00  0.00192  -0.00534  -0.00254  0.00023  0.00254  0.00534  0.00192 (Line 1)
-2.00  0.00453  -0.00322  -0.00676  0.00049  0.00676  0.00322  0.00453
-1.00  0.00331  -0.00845  -0.00769  0.00102  0.00769  0.00845  0.00331
 0.00  0.00023  -0.00223  -0.00787  0.00089  0.00787  0.00223  0.00023
 1.00  0.00134  -0.00308  -0.00675  0.00101  0.00675  0.00308  0.00134
 2.00  0.00079  -0.00148  -0.00234  0.00121  0.00234  0.00148  0.00079
```

**Prototype**

```c
int XYDualCorrectorMappingGet(
    int SocketID,
    char * PositionerName,
    int* LineNumber,
    double* Value1,
    double* Value2,
    ...
)
```

**Input parameters**

- **SocketID** (int) – Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** (char *) – XY positioner name.
- **LineWidth** (int) – Mapping line to read.
Output parameters
Value1  double *  Data of column #1 of line #LinerNumber of the mapping file #MappingNumber.
Value2  double *  Data of column #2 of line #LinerNumber of the mapping file #MappingNumber.
…  double *  One data per column of line #LinerNumber of the mapping file #MappingNumber.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0:  No error.
• -9:  Wrong number of parameters in the command.
• -17:  Parameter out of range or incorrect.
• -18:  PositionerName doesn’t exist or unknown command.
• -24:  Not available in this configuration (secondary positioner is not allowed).
• -121:  Function is not allowed due to mapping disabled.
7.2.1.417 XYDualCorrectorMappingSet [Extended]

**Name**

*XYDualCorrectorMappingSet* – Change data of a line of an XY dual corrector mapping matrix in the controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Check DualCorrectorSwitch (firmware.ref, must be Enabled): (-121)
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 2 and ≤ MappingColumnNumber+2): (-9)
- Checks mapping enable state (must be Enabled): (-121)
- Checks group state (must be NOTINIT, DISABLE or READY at HomePreset position): (-205)

**Description**

Change data of a line of a XY dual corrector mapping matrix.

It's possible to execute this function only when the XY group is in one of following states *(otherwise API returns error -205)* :

- NOTINIT
- DISABLE
- READY and all positioners (X and Y) are at HomePreset position.

**Example:**

<table>
<thead>
<tr>
<th>0</th>
<th>-3.00</th>
<th>-2.00</th>
<th>-1.00</th>
<th>0.00</th>
<th>1.00</th>
<th>2.00</th>

int XYDualCorrectorMappingSet(
    int SocketID,
    char * PositionerName,
    int LineNumber,
    double Value1,
    double Value2,
    ...
)

Input parameters

SocketID    int    Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName    char    *    XY positioner name.
LineNumber    int    Mapping line to change.
Value1    double    Data of column #1 of line #LineNumber of the mapping file #MappingNumber
Value2    double    Data of column #2 of line #LineNumber of the mapping file #MappingNumber
...
    double    One data per column of line #LineNumber of the mapping file #MappingNumber

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -9: Wrong number of parameters in the command.
- -17: Parameter out of range or incorrect.
- -18: PositionerName doesn't exist or unknown command.
- -22: Not allowed action
- -24: Not available in this configuration (secondary positioner is not allowed).
- -121: Function is not allowed due to mapping disabled.
- -205: Not enable in your configuration.
7.2.1.418 XYGantryDestressingMappingGet [Extended]

Name

XYGantryDestressingMappingGet – Read data of a line of an XY gantry destressing mapping matrix in the controller.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Check XYGantryDestressingMappingSwitch (firmware.ref, must be Enabled): (-121)
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 2 and ≤ MappingColumnNumber+2): (-9)
- Checks mapping enable state (must be Enabled): (-121)

Description

Read data of a line of a XY gantry destressing mapping matrix in the controller.

Example:

<p>| | | | | | | |</p>
<table>

</table>

Prototype

```c
int XYGantryDestressingMappingGet ( int SocketID,
                                 char * PositionerName,
                                 int* LineNumber,
                                 double* Value1,
                                 double* Value2,
                                 ... )
```

Input parameters

<table>
<thead>
<tr>
<th>Nombre</th>
<th>Tipo</th>
<th>Descripción</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>PositionerName</td>
<td>char *</td>
<td>XY positioner name.</td>
</tr>
<tr>
<td>LineNumber</td>
<td>int</td>
<td>Mapping line to read.</td>
</tr>
</tbody>
</table>
Output parameters

Value1  double *  Data of column #1 of line #LinerNumber of the mapping file #MappingNumber.

Value2  double *  Data of column #2 of line #LinerNumber of the mapping file #MappingNumber.

…  double *  One data per column of line #LinerNumber of the mapping file #MappingNumber.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -9:  Wrong number of parameters in the command.
- -17:  Parameter out of range or incorrect.
- -18:  PositionerName doesn't exist or unknown command.
- -24:  Not available in this configuration (secondary positioner is not allowed).
- -121:  Function is not allowed due to mapping disabled.
7.2.1.419 **XYGantryDestressingMappingSet [Extended]**

**Name**

**XYGantryDestressingMappingSet** – Change data of a line of an XY gantry destressing mapping matrix in the controller.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Check XYGantryDestressingMappingSwitch (firmware.ref, must be Enabled): (-121)
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 2 and ≤ MappingColumnNumber+2): (-9)
- Checks mapping enable state (must be Enabled): (-121)
- Checks group state (must be NOTINIT, DISABLE or READY at HomePreset position): (-205)

**Description**

Change data of a line of a XY gantry destressing mapping matrix.

It’s possible to execute this function only when the XY group is in one of following states *(otherwise API returns error -205)*:

- NOTINIT
- DISABLE
- READY and all positioners (X and Y) are at HomePreset position.

**Example:**

```
<table>
<thead>
<tr>
<th>Line</th>
<th>0</th>
<th>-30.0</th>
<th>-2.00</th>
<th>-1.00</th>
<th>0.00</th>
<th>1.00</th>
<th>2.00</th>
<th>3.00</th>
</tr>
</thead>
<tbody>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -9: Wrong number of parameters in the command.
- -17: Parameter out of range or incorrect.
- -18: PositionerName doesn't exist or unknown command.
- -22: Not allowed action
- -24: Not available in this configuration (secondary positioner is not allowed).
- -121: Function is not allowed due to mapping disabled.
- -205: Not enable in your configuration.
### 7.2.1.420 XYMappingGet

#### Name

**XYMappingGet** – Read data of a line of an XY mapping matrix in the controller.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks MappingNumber (must be > 0 and ≤ 1 (standard firmware) or 3 (Precision Platform firmware)): (-9)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 3 and ≤ MappingColumnNumber+3): (-9)
- Checks mapping enable state (must be Enabled): (-121)

#### Description

Read data of a line of a XY mapping matrix in the controller.

#### Example:

```
<table>
<thead>
<tr>
<th>Line</th>
<th>Value1</th>
<th>Value2</th>
<th>Value3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.00192</td>
<td>0.00534</td>
<td>0.00254</td>
</tr>
<tr>
<td>-3.00</td>
<td>-0.000254</td>
<td>0.0023</td>
<td>0.00534</td>
</tr>
<tr>
<td>-2.00</td>
<td>-0.00453</td>
<td>-0.00228</td>
<td>-0.00787</td>
</tr>
<tr>
<td>-1.00</td>
<td>-0.00331</td>
<td>-0.00845</td>
<td>-0.00769</td>
</tr>
<tr>
<td>0.00</td>
<td>-0.00787</td>
<td>-0.00228</td>
<td>-0.00787</td>
</tr>
<tr>
<td>1.00</td>
<td>-0.00232</td>
<td>-0.00210</td>
<td>-0.00342</td>
</tr>
<tr>
<td>2.00</td>
<td>-0.00134</td>
<td>-0.00308</td>
<td>-0.00675</td>
</tr>
<tr>
<td>3.00</td>
<td>-0.00789</td>
<td>-0.00148</td>
<td>-0.00234</td>
</tr>
</tbody>
</table>
```

#### Prototype

```c
int XYMappingGet(  
    int SocketID,  
    char * PositionerName,  
    int* MappingNumber,  
    int* LineNumber,  
    double* Value1,  
    double* Value2,  
    ...  
)  
```

#### Input parameters

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**  
  char *  
  XY positioner name.
- **MappingNumber**  
  int  
  XY mapping matrix number.
- **LineNumber**  
  int  
  Mapping line to read.
Output parameters

Value1    double *  Data of column #1 of line #LinerNumber of the mapping file #MappingNumber.

Value2    double *  Data of column #2 of line #LinerNumber of the mapping file #MappingNumber.

…       double *  One data per column of of line #LinerNumber of the mapping file #MappingNumber.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -9: Wrong number of parameters in the command.
• -17: Parameter out of range or incorrect.
• -18: PositionerName doesn't exist or unknown command.
• -24: Not available in this configuration (secondary positioner is not allowed).
• -121: Function is not allowed due to mapping disabled.
7.2.1.421 XYMappingSet

Name

XYMappingSet – Change data of a line of an XY mapping matrix in the controller.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name (must be a XY positioner): (-18)
- Checks the secondary positioner (must not be a secondary positioner): (-24)
- Checks MappingNumber (must be > 0 and ≤ 1 (standard firmware) or 3 (Precision Platform firmware)): (-9)
- Checks LineNumber (must be ≥ 1 and ≤ MappingLineNumber): (-9)
- Checks the number of parameters (must be > 3 and ≤ MappingColumnNumber+3): (-9)
- Checks mapping enable state (must be Enabled): (-121)
- Checks group state (must be NOTINIT, DISABLE or READY at HomePreset position): (-205)

Description

Change data of a line of an XY mapping matrix.

It’s possible to execute this function only when the XY group is in one of following states (otherwise API returns error -205):

- NOTINIT
- DISABLE
- READY and all positioners (X and Y) are at HomePreset position.

Example:

<table>
<thead>
<tr>
<th>0</th>
<th>-3.00</th>
<th>-2.00</th>
<th>-1.00</th>
<th>0.00</th>
<th>1.00</th>
<th>2.00</th>

</tr>
</tbody>
</table>
Prototype

```c
int XYMappingSet(
    int SocketID,
    char * PositionerName,
    int MappingNumber,
    int LineNumber,
    double Value1,
    double Value2,
    ...)
```

**Input parameters**

- **SocketID**
  - `int` Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**
  - `char *` XY positioner name.
- **MappingNumber**
  - `int` XY mapping matrix number.
- **LineNumber**
  - `int` Mapping line to change.
- **Value1**
  - `double` Data of column #1 of line #LineNumber of the mapping file #MappingNumber
- **Value2**
  - `double` Data of column #2 of line #LineNumber of the mapping file #MappingNumber
- **...**
  - `double` One data per column of line #LineNumber of the mapping file #MappingNumber

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -9: Wrong number of parameters in the command.
- -17: Parameter out of range or incorrect.
- -18: PositionerName doesn't exist or unknown command.
- -22: Not allowed action
- -24: Not available in this configuration (secondary positioner is not allowed).
- -121: Function is not allowed due to mapping disabled.
- -205: Not enable in your configuration.
7.2.1.422 XYPTExecution [Extended]

Name
XYPTExecution – Executes a PT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a XY group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function executes a PT (Position Time) trajectory. The trajectory file must be stored in the folder “\Admin\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned.

Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “XYPTVerification” and “XYPTVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

NOTES
In case of (-33) error, (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

This function can be used only with the XPS-Q Precision Platform controller.

Prototype
```c
int XYPTExecution(  
    int SocketID,  
    char GroupName[250],  
    char FileName[250],  
    int ExecutionNumber  
)```
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>FileName</td>
<td>char *</td>
<td>Trajectory file name.</td>
</tr>
<tr>
<td>ExecutionNumber</td>
<td>int</td>
<td>Number of trajectory executions.</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn’t exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
- -25: Following Error.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn’t exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.423 **XYPTLoadToMemory** [Extended]

**Name**
 XYPTLoadToMemory – Load some lines of PT trajectory to the controller memory.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and \( \leq 400 \)): (-3) or (-17)
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**
This function loads some lines of PT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “|” and “\n” two successive characters). To verify or to execute the PT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

---

**NOTE**
All of the PT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PT trajectory in RAM as it does from a disk.

**Example:**
```c
XYPTLoadToMemory(socketId,myGroup,"dT1,dX11,dX12#…dTn,dXn1,dXn2#")
XYPTVerification(socketId,myGroup,FromMemory)
XYPTExecution(socketId,myGroup,FromMemory,1).
```

**Prototype**
```c
int XYPTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char TrajectoryData[400]
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **TrajectoryData** char * Trajectory data lines.

**Output parameters**
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.424 **XYPTParametersGet** [Extended]

**Name**
XYPTParametersGet – Gets PT trajectory parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PT): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**
This function returns the PT trajectory parameters (trajectory name and current executing element number) of the current PT trajectory.

**Prototype**
```
int XYPTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**
- **FileName** char * Currently executing trajectory file name.
- **CurrentElementNumber** int * Currently executing element number.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
7.2.1.425 XYPTPulseOutputGet [Extended]

**Name**

XYPTPulseOutputGet – Gets the configuration of pulse generation of a PT trajectory.

**Input tests**

- Refer to section 7:1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function returns the last configuration of pulse generation of a PT trajectory, that was previously set by XYPTPulseOutputSet().

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

**Example:**

XYPTPulseOutputSet(MyGroup, 3, 5, 0.01)

XYPTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is error return, means OK)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

Start element = 3

End element = 5

Time interval = 0.01 seconds.

**Prototype**

```c
int XYPTPulseOutputGet(
    int SocketID,
    char GroupName[250],
    int * StartElement,
    int * EndElement,
    double * TimeInterval
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

**Output parameters**

- **StartElement** int * Start pulse element number.
- **EndElement** int * End pulse element number.
- **TimeInterval** double * Time interval between pulses (seconds).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
- -24: Not available in this configuration.
### 7.2.1.426 XYPTPulseOutputSet [Extended]

#### Name

**XYPTPulseOutputSet** – Sets the configuration of pulse generation of a PT trajectory.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

#### Description

This function configures and activates the pulse generation of a PT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PT trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PT trajectory. The pulses are generated between the first and the last trajectory element. The minimum possible time interval is CorrectorISRPeriod value (`system.ref`).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual, Appendix / General I/O Description.

**Example:**

```
XYPTPulseOutputSet(Group1, 3, 5, 0.01)
```

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

#### Prototype

```
int XYPTPulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
```
**Input parameters**

- **SocketID** int  
  Socket identifier gets by the "TCP_ConnectToServer" function.
- **GroupName** char *  
  Group name.
- **StartElement** int  
  Start pulse element number.
- **EndElement** int  
  End pulse element number.
- **TimeInterval** double  
  Time interval between pulses (seconds).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-22:** Not allowed action.
- **-24:** Not available in this configuration.
7.2.1.427 XYPTResetInMemory [Extended]

Name
XYPTResetInMemory – Deletes the content of the PT trajectory buffer in the controller memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function deletes the PT trajectory buffer in the controller memory, that was previously loaded with the “XYPTLoadToMemory” function.

Prototype
int XYPTResetInMemory(
    int SocketID,
    char GroupName[250]
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.428 XYPTVerification [Extended]

Name

XYPTVerification – Checks a PT trajectory data file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤ 250): (-3)
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory file existence and the file format: (-66)
- Checks velocity (MinimumVelocity ≤ Velocity ≤ MaximumVelocity): (-68)
- Checks acceleration (MinimumAcc. ≤ Acceleration ≤ MaximumAcc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

Description

This function verifies the execution of a PT trajectory. The results of the verification can be got with the “XYPTVerificationResultGet” function. The trajectory file must be stored in the folder “ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

• This function can be executed at any time and is independent of the trajectory execution. It performs the following:
  • Checks the trajectory file for data coherence.
  • Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
  • The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a PT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
  • If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

NOTES

Because of the PT trajectory internal calculation of elements end velocity, a correct PT trajectory file must have at least two lines with zero displacements at the trajectory end. Otherwise, the “XYPTVerification” function returns the (-70) error.

The “XYPTVerification” function is independent from the “XYPTEexecution” function, but it is highly recommended to execute this function before executing a PT trajectory.

This function can be used only with the XPS-Q Precision Platform controller.

Prototype
int XYPTVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>GroupName</td>
<td>char *</td>
<td>Group name.</td>
</tr>
<tr>
<td>FileName</td>
<td>char *</td>
<td>Trajectory file name.</td>
</tr>
</tbody>
</table>

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-3:** String too long.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-24:** Not available in this configuration.
- **-61:** Error file corrupt or file doesn't exist.
- **-66:** Trajectory doesn't contain any element.
- **-68:** Acceleration on trajectory is too big.
- **-69:** Acceleration on trajectory is too big.
- **-70:** Final velocity on trajectory is not zero.
- **-72:** Error trajectory initialization.
- **-75:** Trajectory element has a negative or null delta T.
7.2.1.429 XYPTVerificationResultGet [Extended]

Name
XYPTVerificationResultGet – Gets the results of the “XYPTVerification” function.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last XY PTVerification (must be done): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the results of the previous “XYPTVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

Prototype
int XYPTVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName char * Positioner name.

Output parameters
TrajectoryFileName char * Examined trajectory file name.
MinimumPosition double * Minimum position (units).
MaximumPosition double * Maximum position (units).
MaximumVelocity double * Maximum velocity (units/s).
MaximumAcceleration double * Maximum acceleration (units/s²).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
7.2.1.430 XYPVTExecution [Extended]

Name
XYPVTExecution – Executes a PVT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a XY group): (-8)
- Checks input value (number of executions must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)

Description
This function executes a PVT (Position Velocity Time) trajectory. The trajectory file must be stored in the folder “\Admin\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned.

Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “XYPVTVerification” and “XYPVTVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

NOTES
In case of an (-33) error, an (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int XYPVTExecution(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    int ExecutionNumber
)
**Input parameters**

- **SocketID** int  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char *  Group name.
- **FileName** char *  Trajectory file name.
- **ExecutionNumber** int  Number of trajectory executions.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
- -25: Following Error.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -46: Not allowed action due to backlash.
- -48: BaseVelocity must be null.
- -61: Error file corrupt or file doesn't exist.
- -71: Error read from or write in message queue.
- -72: Error trajectory initialization.
7.2.1.431 XYPVTLoadToMemory [Extended]

Name
XYPVTLoadToMemory – Load some lines of PVT trajectory to the controller memory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory data (data length must >0 and ≤400): (-3) or (-17)
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function loads some lines of PVT trajectory into XPS controller memory. Each trajectory element must be separated by a comma (“,”). The trajectory lines (data blocks) must be separated between them by a “#” character (or “\” and “n” two successive characters). To verify or to execute the PVT trajectory loaded in memory, use the string “FromMemory” instead of a file name.

NOTE
All of the PVT functions, when called with the string “FromMemory” instead of a FileName, will perform the same operation as the PVT trajectory in RAM as it does from a disk.

Example:

XYPVTLoadToMemory(socketId,myGroup,"dT1,dX11,Vout11,dX12,Vout12#…dTn,dXn1,Voutn1,dXn2,Voutn2#")
XYPVTVerification (socketId,myGroup,FromMemory)
XYPVTExecution(socketId,myGroup,FromMemory,1).

Prototype

int XYPVTLoadToMemory(
    int SocketID,
    char GroupName[250],
    char TrajectoryData[400]
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.
TrajectoryData char * Trajectory data lines.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
### 7.2.1.432 XYPVTParametersGet [Extended]

**Name**

XYPVTParametersGet – Gets PVT trajectory parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be PVT): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function returns the PVT trajectory parameters (trajectory name and current executing element number) of the current PVT trajectory.

**Prototype**

```c
int XYPVTParametersGet(
    int SocketID,
    char GroupName[250],
    char * FileName,
    int * CurrentElementNumber
);
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

**Output parameters**

- **FileName**
  - char *
  - Currently executing trajectory file name.
- **CurrentElementNumber**
  - int *
  - Currently executing element number.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: Group name doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-24**: Not available in this configuration.
7.2.1.433 XYPVTPulseOutputGet [Extended]

Name
XYPVTPulseOutputGet – Gets the configuration of pulse generation of a PVT trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the last configuration of pulse generation of a PVT trajectory, that was previously set by XYPVTPulseOutputSet().

The pulse output configuration is defined with a start element, an end element, and a time interval in seconds.

Example:
XYPVTPulseOutputSet(MyGroup, 3, 5, 0.01)
XYPVTPulseOutputGet(MyGroup) => 0,3,5,0.01 (0 is error return, means OK)
One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.
Start element = 3
End element = 5
Time interval = 0.01 seconds.

Prototype
int XYPVTPulseOutputGet(
    int SocketID,
    charGroupName[250],
    int * StartElement,
    int * EndElement,
    double * TimeInterval
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
StartElement int * Start pulse element number.
EndElement int * End pulse element number.
TimeInterval double * Time interval between pulses (seconds).
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn’t exist or unknown command.
- -24: Not available in this configuration.
7.2.1.434 XYPVT PulseOutputSet [Extended]

**Name**

XYPVT PulseOutputSet – Sets the configuration of pulse generation of a PVT trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function configures and activates the pulse generation of a PVT trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected PVT trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows output of pulses at constant time intervals on a PVT trajectory. The pulses are generated between the first and the last trajectory element. The minimum possible time interval is CorrectorISRPeriod value (system.ref).

The trajectory pulses are generated on the following GPIO outputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pules</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual, Appendix / General I/O Description.

**Example:**

XYPVT PulseOutputSet(Group1, 3, 5, 0.01)

One pulse will be generated every 10 ms between the start of the 3rd element and the end of the 5th element.

**Prototype**

```c
int XYPVT PulseOutputSet(
    int SocketID,
    char GroupName[250],
    int StartElement,
    int EndElement,
    double TimeInterval
)
```
**Input parameters**

- **SocketID** (int): Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** (char *): Group name.
- **StartElement** (int): Start pulse element number.
- **EndElement** (int): End pulse element number.
- **TimeInterval** (double): Time interval between pulses (seconds).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-19**: Group name doesn't exist or unknown command.
- **-22**: Not allowed action.
- **-24**: Not available in this configuration.
7.2.1.435 XYPVTResetInMemory [Extended]

**Name**

XYPVTResetInMemory – Deletes the content of the PVT trajectory buffer in the controller memory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

**Description**

This function deletes all data of PVT trajectory buffer in the memory, that was previously loaded with the “XYPVTLoadToMemory” function.

**Prototype**

```c
int XYPVTResetInMemory (
    int SocketID,
    char GroupName[250],
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name (must be XY group).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
7.2.1.436 XYPVTVerification [Extended]

Name

XYPVTVerification – Checks a PVT trajectory data file.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤250): (-3)
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)
- Checks BaseVelocity value (must = 0): (-48)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory file existence and the file format: (-66)
- Checks velocity (Minimum Velocity ≤Velocity ≤Maximum Velocity): (-68)
- Checks acceleration (Minimum acc. ≤acceleration ≤Maximum acc.): (-69)
- Checks end output velocity (must = 0): (-70)
- Checks delta time (DeltaTime must >0): (-75)

Description

This function verifies the execution of a PVT trajectory. The results of the verification can be got with the “XYPVTVerificationResultGet” function. The trajectory file must be stored in the folder “\ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:

- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a PVT trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

NOTE

The “XYPVTVerification” function is independent from the “XYPVTExecution” function, but it is highly recommended to execute this function before executing a PVT trajectory.

Prototype

int XYPVTVerification(
    int SocketID,
    char GroupName[250],
    char FileName[250]
)
**Input parameters**

SocketID int
Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char *
Group name.

FileName char *
Trajectory file name.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -24: Not available in this configuration.
- -61: Error file corrupt or file doesn't exist.
- -66: Trajectory doesn't content any element.
- -68: Velocity on trajectory is too big.
- -69: Acceleration on trajectory is too big.
- -70: Final velocity on trajectory is not zero.
- -72: Error trajectory initialization.
- -75: Trajectory element has a negative or null delta T.
7.2.1.437 XYPVTVerificationResultGet [Extended]

Name
XYPVTVerificationResultGet – Gets the results of the “XYPVTVerification” function.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must \( \leq 250 \)): (-3)
- Checks positioner name: (-18)
- Checks the last XY PVTVerification (must be done): (-22)
- Not available in this configuration (PrecisionPlatform firmware only): (-24)

Description
This function returns the results of the previous “XYPVTVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

Prototype
```c
int XYPVTVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

Input parameters
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName** char * Positioner name.

Output parameters
- **TrajectoryFileName** char * Examined trajectory file name.
- **MinimumPosition** double * Minimum position (units).
- **MaximumPosition** double * Maximum position (units).
- **MaximumVelocity** double * Maximum velocity (units/s).
- **MaximumAcceleration** double * Maximum acceleration (units/s²).
**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0:  No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
- -24: Not available in this configuration.
7.2.1.438 **XYZGroupPositionCorrectedProfilerGet**

**Name**

*XYZGroupPositionCorrectedProfilerGet* – Gets the corrected profiler position for all positioners of an XYZ group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Valids group type (must be an XYZ group): (-18)
- Invalid group name: (-19)

**Description**

This function corrects a theoretical position which is recalculated with the XYZ mapping correction.

This function applies the XYZ mapping on the theoretical user positions and returns the corrected positions. These corrected profiler positions (X, Y and Z) take the XYZ mapping correction into account.

**NOTE**

This function is only allowed with an XYZ group.
Prototype
int XYZGroupPositionCorrectedProfilerGet(
    int SocketID,
    char * GroupName,
    char * FileName,
    double PositionX,
    double PositionY,
    double PositionZ,
    double * CorrectedPositionX,
    double * CorrectedPositionY,
    double * CorrectedPositionZ
);
7.2.1.439 XYZGroupPositionPCORawEncoderGet

Name

XYZGroupPositionPCORawEncoderGet – Gets the PCO raw encoder positions of an XYZ group.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Valids object type: (-8)
- Valids group type (must be a XYZ group): (-18)
- Invalid group name: (-19)

Description

This function returns the X, Y and Z PCO raw encoder positions from the X, Y and Z user positions.

NOTE

This function is only allowed with a XYZ group.

Prototype

```c
int XYZGroupPositionPCORawEncoderGet(
    int SocketID,
    char * GroupName,
    double PositionX,
    double PositionY,
    double PositionZ,
    double * PCORawPositionX,
    double * PCORawPositionY,
    double * PCORawPositionZ,
)
```

Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * XYZ group name.
- **PositionX** double User position X.
- **PositionY** double User position Y.
- **PositionZ** double User position Z.

Output parameters

- **PCORawPositionX** double * PCO Raw position X.
- **PCORawPositionY** double * PCO Raw position Y.
- **PCORawPositionZ** double * PCO Raw position Z.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.440 XYZSplineExecution

Name
XYZSplineExecution – Executes a Spline trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length: (-3)
- Checks group type (must be a XYZ group): (-8)
- Checks input value (Velocity and Acceleration must >0): (-17)
- Checks group name: (-19)
- Group state must be "READY": (-22)
- Checks backlash (must not be enabled): (-46)
- Checks BaseVelocity (stages.ini, must = 0): (-48)
- Checks trajectory file existence or file reading: (-61)
- Checks message queue: (-71)
- Checks the velocity (Velocity ≤ TrajectoryMaximumVelocity): (-68)
- Checks the acceleration (Acceleration ≤ TrajectoryMaximumAcceleration): (-69)

Description
This function executes a Spline trajectory. The trajectory file must be stored in the folder "\Admin\Public\Trajectory" of the XPS controller. If the trajectory cannot be initialized (message queue or task error) then (-72) is returned.

Before a trajectory execution, it is recommended to check whether the trajectory is within the positioner motion capabilities by using “XYZSplineVerification” and “XYZSplineVerificationResultGet” functions.

During the trajectory execution, if a positioner reaches one of travel limits, the trajectory execution will stop and the (-25) error is generated in the positioner errors.

NOTE
In case of an (-33) error, an (-25) error or (-44) error, the group state becomes DISABLE. To help determine the error source, check the positioner errors, the hardware status and the driver status.

Prototype
int XYZSplineExecution(
    int SocketID,
    char GroupName[250],
    char FileName[250],
    double Velocity,
    double Acceleration
)

**Input parameters**

- **SocketID**: int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**: char *  
  Group name.
- **FileName**: char *  
  Trajectory file name.
- **Velocity**: double  
  Trajectory velocity (units/s).
- **Acceleration**: double  
  Trajectory acceleration (units/s²).

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0**: No error.
- **-3**: String too long.
- **-8**: Wrong object type for this command.
- **-17**: Parameter out of range or incorrect.
- **-19**: Group name doesn’t exist or unknown command.
- **-22**: Not allowed action.
- **-25**: Following Error.
- **-33**: Motion done timeout.
- **-44**: Slave error disabling master.
- **-46**: Not allowed action due to backlash.
- **-48**: BaseVelocity must be null.
- **-61**: Error file corrupt or file doesn’t exist.
- **-68**: Velocity on trajectory is too big.
- **-69**: Acceleration on trajectory is too big.
- **-71**: Error read from or write in message queue.
- **-72**: Error trajectory initialization.
7.2.1.441 XYZSplineParametersGet

Name
XYZSplineParametersGet – Gets Spline trajectory parameters.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XYZ group): (-8)
- Checks group name: (-19)
- Checks current executing trajectory type (must be Spline): (-22)

Description
This function returns the Spline trajectory parameters (trajectory name, trajectory velocity, trajectory acceleration, current executing element number) of the current Spline trajectory.

 Prototype
int XYZSplineParametersGet(  
    int SocketID,  
    char GroupName[250],  
    char * FileName,  
    double * Velocity,  
    double * Acceleration,  
    int * CurrentElementNumber  
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * Group name.

Output parameters
FileName char * Currently executing trajectory file name.
Velocity double * Trajectory velocity (units/s).
Acceleration double * Trajectory acceleration (units/s²).
CurrentElementNumber int * Currently executing element number.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.442 XYZSplinePulseOutputGet

Name
XYZSplinePulseOutputGet – Gets the configuration of pulse generation of a Spline trajectory.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XYZ group): (-8)
- Checks group name: (-19)

Description
This function returns the last configuration of pulse generation of a Spline trajectory, that was previously set by XYZSplinePulseOutputSet(). The pulse output configuration is defined by a pulse start trajectory curved length, a pulse end trajectory curved length, and a pulse trajectory curved length interval.

Example:
XYZSplinePulseOutputSet(MyGroup, 10, 30, 0.01)
XYZSplinePulseOutputGet(MyGroup) => 0,10,30,0.01 (0 is error return, means OK)
One pulse will be generated every 10 μm on the Spline trajectory between 10 mm and 30 mm trajectory curved lengths.
- Pulse start trajectory curved length = 10 mm
- Pulse end trajectory curved length = 30 mm
- Pulse trajectory curved length interval = 0.01 mm.

Prototype
int XYZSplinePulseOutputGet(
    int SocketID,
    char GroupName[250],
    double * StartLength,
    double * EndLength,
    double * PathLengthInterval
)

Input parameters
- SocketID: int Socket identifier gets by the “TCP_ConnectToServer” function.
- GroupName: char * Group name.

Output parameters
- StartLength: double * Pulse start length (units).
- EndLength: double * Pulse end length (units).
- PathLengthInterval: double * Pulse length interval (units).
**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
7.2.1.443 \texttt{XYZSplinePulseOutputSet}

**Name**

\texttt{XYZSplinePulseOutputSet} – Sets the configuration of pulse generation of a Spline trajectory.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XYZ group): (-8)
- Checks group name: (-19)
- Checks the pulse generation must not be in progress: (-22)

**Description**

This function configures and activates the pulse generation of a Spline trajectory. The pulse generation is defined by a start element, an end element, and a time interval in seconds. If a pulse generation is already activated on the selected Spline trajectory then this function returns -22 (“Not allowed action”) error.

Please note that the pulse output settings are automatically removed when the trajectory is over. Hence, with the execution of every new trajectory, it is required to define the pulse output settings again.

This capability allows to generate pulses at constant pulse trajectory curved length intervals on a Spline trajectory. The pulses are generated between a pulse start trajectory curved length and a pulse end trajectory curved length. All lengths are calculated in an orthogonal XYZ coordination system.

The trajectory pulses are generated on the following GPIO ouputs:

<table>
<thead>
<tr>
<th>GPIO signals</th>
<th>ISA XPS controller</th>
<th>PCI XPS controller (for example XPS-RL) with basic GPIO board</th>
<th>PCI XPS controller (for example XPS-RL) with extended GPIO board</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>GPIO2, pin 11</td>
<td>GPIO1.DO6</td>
<td>GPIO5.DO14</td>
</tr>
<tr>
<td>Pulses</td>
<td>GPIO2, pin 12</td>
<td>GPIO1.DO7</td>
<td>GPIO5.DO15</td>
</tr>
</tbody>
</table>

To find the GPIO connector pin number from GPIOx.DOy, refer to XPS User’s Manual, Appendix / General I/O Description.

**Example:**

\texttt{XYZSplinePulseOutputSet(Group1, 10, 30, 0.01)}

One pulse will be generated every 10 μm on the Spline trajectory between 10 mm and 30 mm trajectory curved lengths.

- Pulse start trajectory curved length = 10 mm
- Pulse end trajectory curved length = 30 mm
- Pulse trajectory curved length interval = 0.01 mm
Prototype

```c
int XYZSplinePulseOutputSet(
    int SocketID,
    char GroupName[250],
    double StartLength,
    double EndLength,
    double PathLengthInterval
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char*: Group name.
- **StartLength** double: Pulse start length (units).
- **EndLength** double: Pulse end length (units).
- **PathLengthInterval** double: Pulse length interval (units).

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-19:** Group name doesn't exist or unknown command.
- **-22:** Not allowed action.
### 7.2.1.444 XYZSplineVerification

**Name**

**XYZSplineVerification** – Checks a Spline trajectory data file.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks trajectory file name length (must ≤250): (-3)
- Checks group type (must be a XYZ group): (-8)
- Checks group name: (-19)
- Checks trajectory file existence and the file format: (-61)
- Checks trajectory (number of elements must >0): (-66)

**Description**

This function verifies the execution of a Spline trajectory. The results of the verification can be got with the “XYZSplineVerificationResultGet” function. The trajectory file must be stored in the folder “\ADMIN\Public\Trajectory” of the XPS controller. If the trajectory cannot be initialized (task error) then the (-72) error is returned.

This function can be executed at any time and is independent of the trajectory execution. It performs the following:

- Checks the trajectory file for data coherence.
- Calculates the trajectory limits, which are: the required travel per positioner, the maximum possible trajectory velocity and the maximum possible trajectory acceleration. This function helps define the parameters for the trajectory execution.
- The required travel values (MinimumPosition and MaximumPosition) are calculated relative to the position zero, not to the current position. So before executing a Spline trajectory, the user must pay attention to the current position of the positioners to make sure that the trajectory will not exceed the positioner travel limits.
- If all is OK, it returns “SUCCESS” (0). Otherwise, it returns a corresponding error.

**NOTE**

The “XYZSplineVerification” function is independent from the “XYZSplineExecution” function, but it is highly recommended to execute this function before executing a Spline trajectory.

**Prototype**

```c
int XYZSplineVerification(  
    int SocketID,
    char GroupName[250],
    char FileName[250]
)
```

**Input parameters**

- **SocketID**: int (Socket identifier gets by the “TCP_ConnectToServer” function.)
- **GroupName**: char * (Group name.)
- **FileName**: char * (Trajectory file name.)
Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -61: Error file corrupt or file doesn't exist.
- -66: Trajectory doesn't contain any element.
- -72: Error trajectory initialization.
7.2.1.445 XYZSplineVerificationResultGet

**Name**

**XYZSplineVerificationResultGet** – Gets the results of the “XYZSplineVerification” function.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks positioner name length (must ≤250): (-3)
- Checks positioner name: (-18)
- Checks the last XYZ SplineVerification (must be done): (-22)

**Description**

This function returns the results of the previous “XYZSplineVerification” function, positioner by positioner. The results are the travel requirements (min and max values), the possible maximum velocity and the possible maximum acceleration.

If no verification was previously done then the (-22) error is returned.

**Prototype**

```c
int XYZSplineVerificationResultGet(
    int SocketID,
    char PositionerName[250],
    char * TrajectoryFileName,
    double * MinimumPosition,
    double * MaximumPosition,
    double * MaximumVelocity,
    double * MaximumAcceleration
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**: char * Positioner name.

**Output parameters**

- **TrajectoryFileName**: char * Examined trajectory file name.
- **MinimumPosition**: double * Minimum position (units).
- **MaximumPosition**: double * Maximum position (units).
- **MaximumVelocity**: double * Maximum velocity (units/s).
- **MaximumAcceleration**: double * Maximum acceleration (units/s²).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -3: String too long.
- -18: Positioner name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.446 **XYScanShutterDisable** [Extended]

**Name**

**XYScanShutterDisable** – disables shutter stage during scan.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Check shutter group existence (-22)

**Description**

This function disables the use of shutter stage during scan for the selected XY group.

**Prototype**

```c
int XYScanShutterDisable (  
    int SocketID,  
    char GroupName[250]  
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char*: Group name.

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.447 XYScanShutterEnable [Extended]

Name

XYScanShutterEnable – enables shutter stage during scan.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Check shutter group existence (-22)

Description

This function enables the use of shutter stage during scan for the selected XY group.

Prototype

int XYScanShutterEnable ( 
    int SocketID, 
    char GroupName[250] 
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName char * Group name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.448 XYShutterInterlockMonitoringDisable [Extended]

Name

**XYShutterInterlockMonitoringDisable** – disables shutter interlock monitoring.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)

Description

This function disables the shutter interlock monitoring for the selected XY group.

Prototype

```c
int XYShutterInterlockMonitoringDisable(
    int SocketID,
    char GroupName[250]
)
```

Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
7.2.1.449 XYShutterInterlockMonitoringEnable  [Extended]

Name

**XYShutterInterlockMonitoringEnable** – enables shutter interlock monitoring.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)

Description

This function enables the shutter interlock monitoring for the selected XY group.

Prototype

```c
int XYShutterInterlockMonitoringEnable (int SocketID, char GroupName[250])
```

Input parameters

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName**
  - char *
  - Group name.

Output parameters

None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
7.2.1.450 **XYShutterInterlockRectParametersGet** [Extended]

**Name**

**XYShutterInterlockRectParametersGet** – gets rectangle shutter interlock parameters.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)

**Description**

This function gets parameters of rectangle shutter interlock.

**Prototype**

```c
int XYShutterInterlockRectParametersGet (  
    int SocketID,  
    char *GroupName[250],  
    double *ImageRefX,  
    double *ImageRefY,  
    double *wl1, double *wl2, double *wl3, double *wl4,  
    double *wr1, double *wr2, double *wr3, double *wr4,  
    double *sL1, double *sL2, double *sL3, double *sL4,  
    double *sR1, double *sR2, double *sR3, double *sR4,  
    double *wMeanPeriod, double *wMeanVelocityMin,  
    double *wMeanVelocityInitial,  
    double *sMeanPeriod, double *sMeanVelocityMin,  
    double *sMeanVelocityInitial,  
    double *oMeanPeriod, double *oMeanVelocityMin,  
    double *oMeanVelocityInitial,  
    double *mL1, double *mL2, double *mR
)
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**  
  char *  
  Group name.

**Output parameters**

- **ImageRefX**  
  double *  
  Image reference in X coordination.

- **ImageRefY**  
  double *  
  Image reference in Y coordination.

- **wl1, wl2, wl3, wl4**  
  double *  
  Wafer zone longer l1, l2, l3 and l4

- **wr1, wr2, wr3, wr4**  
  double *  
  Wafer zone radius r1, r2, r3 and r4

- **sL1, sL2, sL3, sL4**  
  double *  
  Skirt zone longer L1, L2, L3 and L4

- **sR1, sR2, sR3, sR4**  
  double *  
  Skirt zone radius R1, R2, R3 and R4

- **wMeanPeriod**  
  double *  
  Wafer zone mean period

- **wMeanVelocityMin**  
  double *  
  Wafer zone mean velocity minimum

- **wMeanVelocityInitial**  
  double *  
  Wafer zone mean velocity initial

- **sMeanPeriod**  
  double *  
  Skirt zone mean period

- **sMeanVelocityMin**  
  double *  
  Skirt zone mean velocity minimum

- **sMeanVelocityInitial**  
  double *  
  Skirt zone mean velocity initial

- **oMeanPeriod**  
  double *  
  Skirt zone mean period

- **oMeanVelocityMin**  
  double *  
  Skirt zone mean velocity minimum

- **oMeanVelocityInitial**  
  double *  
  Skirt zone mean velocity initial

- **mL1, mL2, mL3, mL4**  
  double *  
  Skirt zone mean period
sMeanVelocityMin  double *  Skirt zone mean velocity minimum
sMeanVelocityInitial double *  Skirt zone mean velocity initial
oMeanPeriod        double *  Other zone mean period
oMeanVelocityMin   double *  Other zone mean velocity minimum
oMeanVelocityInitial double *  Other zone mean velocity initial
mL1, mL2, mR       double *  Mirror zone longer (X,Y) and radius

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
7.2.1.451 **XYShutterInterlockRectParametersSet** [Extended]

**Name**

**XYShutterInterlockRectParametersSet** – sets rectangle shutter interlock parameters.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks if ShutterInterlockMonitoringFlag = false (-22 otherwise)
- Checks w11, w12, w13, w14, w1, w2, w3, w4 >= 0; (-17 otherwise)
- Checks sL1, sL2, sL3, sL4, sR1, sR2, sR3, sR4 >= 0; (-17 otherwise)
- Checks –w11 + w1 <= w2 – w2: (-17 otherwise)
- Checks –w11 + w3 <= w2 – w4: (-17 otherwise)
- Checks –w14 + w3 <= w3 – w1: (-17 otherwise)
- Checks –w14 + w4 <= w3 – w2: (-17 otherwise)
- Checks –sL1 + sR1 <= sL2 – sR2: (-17 otherwise)
- Checks –sL1 + sR3 <= sL2 – sR4: (-17 otherwise)
- Checks –sL4 + sR3 <= sL3 – sR1: (-17 otherwise)
- Checks –sL4 + sR4 <= sL3 – sR2: (-17 otherwise)
- Checks wMeanPeriod >= 10*CorrectorISRPeriod*ProfileGeneratorISRRatio: (-17 otherwise)
- Checks wMeanVelocityMin >= 0: (-17 otherwise)
- Checks sMeanPeriod >= 10*CorrectorISRPeriod*ProfileGeneratorISRRatio: (-17 otherwise)
- Checks sMeanVelocityMin >= 0: (-17 otherwise)
- Checks oMeanPeriod >= 10*CorrectorISRPeriod*ProfileGeneratorISRRatio: (-17 otherwise)
- Checks oMeanVelocityMin >= 0: (-17 otherwise)

**Description**

This function sets parameters of rectangle shutter interlock.

**Prototype**

```c
int XYShutterInterlockRectParametersSet ( int SocketID, 
    char GroupName[250],
    double ImageRefX, 
    double ImageRefY,
    double w11, double w12, double w13, double w14, 
    double w1, double w2, double w3, double w4, 
    double sL1, double sL2, double sL3, double sL4, 
    double sR1, double sR2, double sR3, double sR4, 
    double wMeanPeriod, double wMeanVelocityMin, 
    double wMeanVelocityInitial,
    double sMeanPeriod, double sMeanVelocityMin, 
    double sMeanVelocityInitial,
    double oMeanPeriod, double oMeanVelocityMin, 
    double oMeanVelocityInitial,
    double mL1, double mL2, double mR )
```

**Input parameters**

- **SocketID**
  - int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

- **GroupName**
  - char *
  - Group name.
ImageRefX           double     Image reference in X coordination.
ImageRefY           double     Image reference in Y coordination.
w1,l1,w3,l4        double     Wafer zone longer l1, l2, l3 and l4
wr1,wr2,wr3,wr4     double     Wafer zone radius r1, r2, r3 and r4
sL1,sL2,sL3,sL4     double     Skirt zone longer L1,L2, L3 and L4
sR1,sR2,sR3,sR4     double     Skirt zone radius R1, R2, R3 and R4
wMeanPeriod         double     Wafer zone mean period
wMeanVelocityMin    double     Wafer zone mean velocity minimum
wMeanVelocityInitial double     Wafer zone mean velocity initial
sMeanPeriod         double     Skirt zone mean period
sMeanVelocityMin    double     Skirt zone mean velocity minimum
sMeanVelocityInitial double     Skirt zone mean velocity initial
oMeanPeriod         double     Other zone mean period
oMeanVelocityMin    double     Other zone mean velocity minimum
oMeanVelocityInitial double     Other zone mean velocity initial
mL1, mL2, mR        double     Mirror zone longer (X,Y) and radius

**Output parameters**

None

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
- **-17:** Parameter out of range or incorrect.
- **-19:** Group name doesn’t exist or unknown command.
- **-22:** Not allowed action.
7.2.1.452 XYScanNextGet [Extended]

Name

XYScanNextGet – gets XY Scan parameters.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)

Description

This function gets parameters of the Scan feature.

Prototype

```c
int XYScanNextGet (  
    int SocketID,  
    char GroupName[250],  
    double *MinStartVelocity,  
    double *MaxStartVelocity,  
    double *StartCheckingTime,  
    double *MinPositionForLaserEnable,  
    double *MaxPositionForLaserEnable,  
    double *MinPositionForNotchStart,  
    double *MaxPositionForNotchEnd  
)
```

Input parameters

- SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
- GroupName char * Group name.

Output parameters

- MinStartVelocity double * Minimum start velocity.
- MaxStartVelocity double * Maximum start velocity.
- StartCheckingTime double * Start checking time.
- MinPositionForLaserEnable double * Laser enable minimum position.
- MaxPositionForLaserEnable double * Laser enable maximum position.
- MinPositionForNotchStart double * Notch start minimum position.
- MaxPositionForNotchEnd double * Notch end maximum position.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -19: Group name doesn't exist or unknown command.
7.2.1.453 XYScanNextSet [Extended]

**Name**

**XYScanNextSet** – sets parameters used for next scan.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks that the system is not scanning (-22 otherwise)
- Checks MaximumStartVelocity ≥ MinimumStartVelocity ≥ 0 (-17 otherwise)
- Checks StartCheckingTime ≥ 0 (-17 otherwise)
- Checks MaximumPositionForLaserEnable >= MinimumPositionForLaserEnable (-17 otherwise)
- Checks MaximumPositionForNotchEnd >= MinimumPositionForNotchStart (-17 otherwise)

**Description**

This function sets the scan parameters used for next scan.

**Prototype**

```c
int XYScanNextSet ( int SocketID,
                    char GroupName[250],
                    double MinStartVelocity,
                    double MaxStartVelocity,
                    double StartCheckingTime,
                    double MinPositionForLaserEnable,
                    double MaxPositionForLaserEnable,
                    double MinPositionForNotchStart,
                    double MaxPositionForNotchEnd
                  )
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **MinStartVelocity** double Minimum start velocity.
- **MaxStartVelocity** double Maximum start velocity.
- **StartCheckingTime** double Start checking time.
- **MinPositionForLaserEnable** double Laser enable minimum position.
- **MaxPositionForLaserEnable** double Laser enable maximum position.
- **MinPositionForNotchStart** double Notch start minimum position.
- **MaxPositionForNotchEnd** double Notch end maximum position.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
-8: Wrong object type for this command.
-17: Parameter out of range or incorrect.
-19: Group name doesn't exist or unknown command.
-22: Not allowed action.
7.2.1.454 XYScanMoveAbsolute [Extended]

Name

XYScanMoveAbsolute – makes a group absolute move for scan purpose.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks target position in relation with the travel limits:
  - TargetPositionX \geq MinimumTargetPosition (-17 otherwise)
  - TargetPositionX \leq MaximumTargetPosition (-17 otherwise)
  - TargetPositionY \geq MinimumTargetPosition (-17 otherwise)
  - TargetPositionY \leq MaximumTargetPosition (-17 otherwise)
- Checks start position in relation with the current position and the target position (-17 otherwise)
- Checks that XYScanNextSet API was executed previously (-22 otherwise)
- Checks group status must be "READY": (-22 otherwise)

Description

This function makes a group absolute move to X and Y target positions for scan purpose.
The absolute move refers to the acceleration, velocity, minimum jerk time and maximum jerk time predefined in the “stages.ini” or redefined with the “PositionerSGammaParametersSet” API.

Prototype

```c
int XYScanMoveAbsolute ( 
    int SocketID, 
    char GroupName[250], 
    double TargetPositionX, 
    double TargetPositionY, 
    double StartPosition, 
    int *ScanErrorCode, 
    double *MinimumRecordedVelocity, 
    double *MaximumRecordedVelocity, 
    double *AverageScanVelocity
)
```

Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **TargetPositionX** double X target position.
- **TargetPositionY** double Y target position.
- **StartPosition** double Start position.

Output parameters

- **ScanErrorCode** int * Scan error code.
- **MinimumRecordedVelocity** double * Minimum recorded velocity.
- **MaximumRecordedVelocity** double * Maximum recorded velocity.
AverageScanVelocity double * Average scan velocity.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -33: Motion done timeout.
7.2.1.455 **XYScanMoveRelative** [Extended]

**Name**

**XYScanMoveRelative** – makes a group relative move for scan purpose.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Checks target position in relation with the travel limits:
  - TargetPositionX ≥ MinimumTargetPosition (17 otherwise)
  - TargetPositionX ≤ MaximumTargetPosition (17 otherwise)
  - TargetPositionY ≥ MinimumTargetPosition (17 otherwise)
  - TargetPositionY ≤ MaximumTargetPosition (17 otherwise)
- Checks start position in relation with the current position and the target position (17 otherwise)
- Checks that XYScanNextSet API was executed previously (-22 otherwise)
- Checks group status must be "READY": (-22 otherwise)

**Description**

This function makes a group relative move with X and Y target displacement for scan purpose. The relative move refers to the acceleration, velocity, minimum jerk time and maximum jerk time predefined in the “stages.ini” or redefined with the “PositionerSGammaParametersSet” API.

**Prototype**

```c
int XYScanMoveRelative (  
    int SocketID,  
    char GroupName[250],  
    double TargetDisplacementX,  
    double TargetDisplacementY,  
    double StartDisplacement,  
    int *ScanErrorCode,  
    double *MinimumRecordedVelocity,  
    double *MaximumRecordedVelocity,  
    double *AverageScanVelocity  
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **TargetDisplacementX** double X target displacement.
- **TargetDisplacementY** double Y target displacement.
- **StartDisplacement** double Start displacement.

**Output parameters**

- **ScanErrorCode** int * Scan error code.
- **MinimumRecordedVelocity** double * Minimum recorded velocity.
- **MaximumRecordedVelocity** double * Maximum recorded velocity.
AverageScanVelocity double * Average scan velocity.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -33: Motion done timeout.
7.2.1.456 XYScanExecutePVT [Extended]

Name

XYScanExecutePVT – Executes a PVT trajectory for X and Y with scan activated.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks group type (must be a XY group): (-8)
- Checks group name: (-19)
- Check trajectory file name: (-61)
- Check execution number > 0: (-17 otherwise)
- Checks that XYScanNextSet API was executed previously: (-22 otherwise)
- Checks group status must be “READY”: (-22 otherwise)

Description

This function executes a PVT trajectory for X and Y with scan activated.

Prototype

```c
int XYScanExecutePVT (  
    int SocketID,  
    char GroupName[250],  
    char PVTTrajectoryFileName[250],  
    int ExecutionNumber,  
    int *ScanErrorCode,  
    double *MinimumRecordedVelocity,  
    double *MaximumRecordedVelocity,  
    double *AverageScanVelocity  
)
```

Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Group name.
- **PVTTrajectoryFileName** char * PVT trajectory file name.
- **ExecutionNumber** int Number of executions.

Output parameters

- **ScanErrorCode** int * Scan error code.
- **MinimumRecordedVelocity** double * Minimum recorded velocity.
- **MaximumRecordedVelocity** double * Maximum recorded velocity.
- **AverageScanVelocity** double * Average scan velocity.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -19: Group name doesn't exist or unknown command.
-22: Not allowed action.
-61: Error file corrupt or file doesn't exist.
-72: Error trajectory initialization.
7.2.1.457 XYClampDisable [Extended]

Name
XYClampDisable – unclamps XY group.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
This function unclamps the selected XY group
The group must be in the CLAMPED state. If unclamping is successful, the group is unclamped and the group state becomes “READY”.

Prototype
int XYClampDisable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
GroupName char * XY group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.458 **XYClampEnable [Extended]**

**Name**

XYClampEnable – clamps a XY group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**

This function clamps the selected XY group.

The group must be in the READY state. If clamping is successful, the group is clamped and the group state becomes “CLAMPED”.

**Prototype**

```c
int XYClampEnable(
    int SocketID,
    char * GroupName
)
```

**Input parameters**

- `SocketID` int: Socket identifier gets by the “TCP_ConnectToServer” function.
- `GroupName` char *: XY group name.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.1.459 **MaskClampDisable** [Extended]

**Name**
MaskClampDisable – Disables Mask clamping.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

**Description**
This function unclamps the Mask group.
The group must be in the CLAMPED state.

**Prototype**
```c
int MaskClampDisable(  
    int SocketID,  
    char * GroupName
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **GroupName** char * Mask group name.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
7.2.1.460 MaskClampEnable [Extended]

Name
MaskClampEnable – Enables Mask clamping.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
This function enables Mask clamping.

Prototype
int MaskClampEnable(
    int SocketID,
    char * GroupName
)

Input parameters
SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.
GroupName char * Mask group name.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn’t exist or unknown command.
- -19: GroupName doesn’t exist or unknown command.
7.2.1.461 MaskClampStateGet [Extended]

Name
MaskClampStateGet – Gets Mask clamping state.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group): (-8)
- Invalid positioner name: (-18)
- Invalid group name: (-19)

Description
This function gets Mask clamping state.
TRUE = Mask clamp is enabled.
False = Mask clamp is disabled.

Prototype
int MaskClampStateGet ( 
   int SocketID,
   char * GroupName
   bool * MaskState
)

Input parameters
SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.
GroupName char * Mask group name.

Output parameters
MaskState bool * Mask clamping state.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Positioner Name doesn't exist or unknown command.
- -19:GroupName doesn't exist or unknown command.
### 7.2.2 Special Functions

The functions described in this section are for a specific controller configuration, please contact Newport for further information.

#### 7.2.2.1 AbortMove

**Name**

AbortMove – abort the motion or the jog in progress for the XY group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function allows aborting a motion or a jog in progress. The group status must be “MOVING” or “JOGGING” else the (-22) error is returned.

If the group status is “MOVING”, this function stops all motion in progress.

If the group status is “JOGGING”, this function stops all “jog” motion in progress and disables the jog mode. After this “group move abort” action, the group status becomes “READY”.

**Prototype**

```c
int AbortMove(  
    int SocketID  
)
```

**Input parameters**

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-27:** Move Aborted.
7.2.2.2 **EndJog**

**Name**

**EndJog** – Disables the jog mode in the XY group.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks the group name: (-19)
- Group status must be “READY”: (-22)

**Description**

This function disables the Jog mode for the first declared XY group. To use this function, the group must be in the “JOGGING” state and all positioners must be idle (means velocity must be 0).

This function allows to exit the “JOGGING” state and to come back to the “READY” state. If the group state is not “JOGGING” or if the profiler velocity is not null then the (-22) error is returned.

**NOTE**

Use the “StartJog” function to enable the jog mode.

**Prototype**

```c
int GetJogAcceleration(
    int SocketID
)
```

**Input parameters**

- `SocketID` int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-18**: Not allowed due to a positioner error or hardware status.
- **-19**: GroupName doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.2.3 GetAccParams

Name

GetAccParams – Gets acceleration parameters for X and Y axes.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description

This API gets the current acceleration parameters for X and Y axes. The smooth factor represents the jerk time and all parameters unit in milliseconds.

Prototype

int GetAccParams(
    int SocketID,
    int * XaccTime_ms,
    int * XsmoothFactor_ms,
    int * YaccTime_ms,
    int * YsmoothFactor_ms
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters

XaccTime_ms int * X acceleration time in msec.
XsmoothFactor_ms int * X Smooth factor in msec (jerk time).
YaccTime_ms int * Y acceleration time in msec.
YsmoothFactor_ms int * Y Smooth factor in msec (jerk time).

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
7.2.2.4  GetBrakeState

Name
GetBrakeState—Gets the brake status.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function reads the current brake command signal state from Inhibit or GPIO connector.

Brake command signal:
- 0 = Brake OFF
- 1 = Brake ON

Prototype
int GetBrakeState(
    int SocketID,
    int * BrakeStatus
)

Input parameters
SocketID  int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
BrakeStatus  int * The brake status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.2.5  GetCurrentPosition

Name
GetCurrentPosition – Gets all current positions of X, X2 and Y.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name is valid: (-18)
- Not allowed due to configuration disabled: (-121)
- Not allowed because group is not initialized or not referenced: (-135)

Description
Read all current positions of Y, X, X2, Y laser and X laser.
Units:
Y and X positions: µm
X1 and X2 positions: counts
Y and X laser positions: counts

Prototype
int GetCurrentPosition (int SocketID, double * y_position_um, double * x_position_um, int * x1_position_cnts, int * x2_position_cnts, int * y_laser_position_cnts, int * x_laser_position_cnts)

Input parameters
SocketID  int  Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
y_position_um  double *  Y position in µm.
x_position_um  double *  X position in µm.
x1_position_cnts  int *  X1 position in counts.
x2_position_cnts  int *  X2 position in counts.
y_laser_position_cnts  int *  Y laser position in counts.
x_laser_position_cnts  int *  X laser position in counts.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -18: PositionerName doesn't exist or unknown command.
- -121: Not allowed due to configuration disabled.
- -135: Not allowed because group is not initialized or not referenced.
7.2.2.6 GetGantryMode

**Name**
GetGantryMode – Gets Gantry mode.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the set option: (-17)
- Checks the group name is valid: (-19)
- Verifies gantry mode getting is allowed: (-22)

**Description**
Get the current gantry option. Three “gantry” options are available:
- Option0 = >Gantry standard.
- Option1 = >Gantry force balance.
- Option2 = >Gantry force balance with interferometer.

**Prototype**
```c
int GetGantryMode(
    int SocketID,
    char * Option
)
```

**Input parameters**
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
Option char * Option selection(Option0, Option1 or Option2).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn’t exist or unknown command.
- -22: Not allowed action.
7.2.2.7  **GetJogAcceleration**

**Name**

*GetJogAcceleration* – Gets the acceleration set by “SetJogAcceleration”.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)

**Description**

This function returns the acceleration setting by the user to use the jog mode for one positioner or for all positioners of the XY group.

**Prototype**

```c
int GetJogAcceleration(  
    int SocketID,  
    int * XaccelerationTime_ms,  
    int * XsmoothFactor_ms,  
    int * YaccelerationTime_ms,  
    int * YsmoothFactor_ms  
)
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

- **XaccelerationTime_ms**  
  int *  
  User jog Acceleration time for X in ms.

- **XsmoothFactor_ms**  
  int *  
  User jog Smooth factor for X in ms.

- **YaccelerationTime_ms**  
  int *  
  User jog Acceleration time for Y in ms.

- **YsmoothFactor_ms**  
  int *  
  User jog Smooth factor for Y in ms.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Not allowed due to a positioner error or hardware status.
- -19: GroupName doesn't exist or unknown command.
7.2.2.8  GetJogVelocity

Name
GetJogVelocity – Changes “on the fly” the velocity in the jog mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY": (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)

Description
This function returns jog velocities and the jog velocity acknowledge timeout in milliseconds used by the jog mode in the XY group.

Prototype
int GetJogVelocity(
    int SocketID,
    double * Xvelocity,
    double * Yvelocity,
    int * joystickAckTimeout_ms
)

Input parameters
SocketID        int    Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
Xvelocity        double * user jog velocity for X in µm/s.
Yvelocity        double * user jog velocity for Y in µm/s.
joystickAckTimeout_ms    int * user jog velocity acknowledge timeout in ms.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
- -18: Not allowed due to a positioner error or hardware status.
- -19: GroupName doesn't exist or unknown command.
7.2.2.9  **GetPistonState**

**Name**

GetPistonState – Gets current status of Piston and Lift Pin.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Read the current status of Piston and Lift Pin:

- Piston command status.
- Piston limit UP (Engaged).
- Piston limit DOWN (Released).
- Lift Pin UP.

**Piston signal meaning:**

<table>
<thead>
<tr>
<th>Piston Command Status</th>
<th>0</th>
<th>Release piston</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Engage piston</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Piston Engaged Status</th>
<th>0</th>
<th>Not Engaged</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Engaged</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Piston Released Status</th>
<th>0</th>
<th>Not Released</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Released</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Lift Pin UP Status</th>
<th>0</th>
<th>DOWN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>UP</td>
</tr>
</tbody>
</table>

**Prototype**

```c
int GetPistonState(
    int SocketID,
    int * CommandState,
    int * isEngaged,
    int * isReleased,
    int * LiftPinUPInterlock
)
```
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CommandState</td>
<td>int *</td>
<td>Status of the Piston command (0 or 1).</td>
</tr>
<tr>
<td>isEngaged</td>
<td>int *</td>
<td>Status of the Piston Engaged (0 or 1).</td>
</tr>
<tr>
<td>isReleased</td>
<td>int *</td>
<td>Status of the Piston Released (0 or 1).</td>
</tr>
<tr>
<td>LiftPinUPInterlock</td>
<td>int *</td>
<td>Status of the Lift Pin UP (0 or 1).</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-7:** Wrong format in the command string.
- **-9:** Wrong number of parameters in the command.
- **-15:** Wrong parameter type in the command string: int, short, int * or short * expected.
### 7.2.2.10 GetVarX

**Name**

GetVarX – Sets new value for a specified parameter name from stages.ini for Y positioner.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

**Description**

Get parameter value from stages.ini file for the X positioner.

**Prototype**

```c
int GetVarX(
    int SocketID,
    char * ParameterName,
    double * ParameterValue
)
```

**Input parameters**

- **SocketID** (`int`): Socket identifier gets by the “TCP_ConnectToServer” function.
- **ParameterName** (`char *`): Stages.ini parameter name.

**Output parameters**

- **ParameterValue** (`double *`): The value to be set for the “ParameterName”.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.11 \textbf{GetVarXSecondary}

\textbf{Name}
\textit{GetVarXSecondary} – Gets the configured value of the parameter name from stages.ini for X secondary positioner.

\textbf{Input tests}
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

\textbf{Description}
Get the configured value of the parameter name from stages.ini for X secondary positioner.

\textbf{Prototype}
\begin{verbatim}
int GetVarXSecondary(
    int SocketID,
    char * ParameterName,
    double * ParameterValue
)
\end{verbatim}

\textbf{Input parameters}
- \texttt{SocketID} \hspace{1cm} \texttt{int} \quad Socket identifier gets by the “TCP_ConnectToServer” function.
- \texttt{ParameterName} \hspace{1cm} \texttt{char *} \quad Stages.ini parameter name.

\textbf{Output parameters}
- \texttt{ParameterValue} \hspace{1cm} \texttt{double *} \quad The value to be set for the “ParameterName”.

\textbf{Return} (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.12 GetVarY

**Name**

GetVarY – Gets the configured value of the parameter name from stages.ini for Y positioner.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

**Description**

Get the configured value of the parameter name from stages.ini for Y positioner.

**Prototype**

```c
int GetVarY(
    int SocketID,
    char * ParameterName,
    double * ParameterValue
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **ParameterName** char * Stages.ini parameter name.

**Output parameters**

- **ParameterValue** double * The value to be set for the “ParameterName”.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.13 **GetVelParams**

**Name**

GetVelParams – Gets current velocity for X and Y axes.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

**Description**

This API updates the current acceleration parameters for X and Y axes. The smooth factor represents the jerk time and all parameters unit in milliseconds.

**Prototype**

```c
int GetVelParams(
    int SocketID,
    double * Xvelocity,
    double * Yvelocity
)
```

**Input parameters**

- **SocketID**
  
  int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **Xvelocity**
  
  double * X velocity in µm/s.

- **Yvelocity**
  
  double * Y velocity in µm/s.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.2.14 GetVerCommand

**Name**
GetVerCommand – Return firmware version.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function returns the controller name and the firmware version number.

Example of returned version string: “XPS-Q8 Firmware V2.1.0”
- Controller name is XPS-Q8.
- Firmware version is V2.1.0.

**Prototype**
```c
int GetVerCommand(  
    int SocketID,  
    char * Version  
)
```

**Input parameters**

- **SocketID**: int, Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **Version**: char *, The firmware version.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
7.2.2.15 GetXVelParams

**Name**
GetXVelParams – This API returns the current velocity parameter in µm/s for X axis.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

**Description**
This API returns the current velocity parameter in µm/s for X axis.

**Prototype**

```c
int GetXVelParams(
    int SocketID,
    double * Xvelocity
)
```

**Input parameters**

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **Xvelocity**: double *
  - X velocity in µm/s.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
7.2.2.16 GetYVelParams

**Name**
GetYVelParams – This API returns the current velocity parameter in µm/s for Y axis.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

**Description**
This API returns the current velocity parameter in µm/s for Y axis.

**Prototype**
```c
int GetYVelParams(
    int SocketID,
    double * Yvelocity
)
```

**Input parameters**
- SocketID int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- Yvelocity double*: Y velocity in µm/s.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.2.17 GetZone

**Name**

GetZone – Gets current parameters of the defined circle zone.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name is valid: (-18)
- Not allowed due to configuration disabled: (-121)
- Not allowed because group is not initialized or not referenced: (-135)

**Description**

Get current parameters of the defined circle zone. A digital output is defined in the stage.ini file. It's always available after the home search. All parameters are defined in μm. The Radius and Hysteresis are defined to signal when going out the circle.

**Prototype**

```c
int GetZone(int SocketID, double * x_center_um, double * y_center_um, double * radius_um, double * hysteresis_um)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x_center_um</td>
<td>double *</td>
<td>X center in μm.</td>
</tr>
<tr>
<td>y_center_um</td>
<td>double *</td>
<td>Y center in μm.</td>
</tr>
<tr>
<td>radius_um</td>
<td>double *</td>
<td>Radius in μm.</td>
</tr>
<tr>
<td>hysteresis_um</td>
<td>double *</td>
<td>Hysteresis in μm.</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -18: PositionerName doesn't exist or unknown command.
- -121: Not allowed due to configuration disabled.
- -135: Not allowed because group is not initialized or not referenced.
7.2.2.18 **InitializeAndHomeX**

**Name**

InitializeAndHomeX – Do home search on X axis.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the set option: (-17)
- Verifies this command is allowed: (-22)
- Checks state of physical ends of run: (-113)
- Checks the opened socked is valid: (-200)
- Checks this command is enabled for the current controller configuration: (-205)

**Description**

Initializes the motor, calibra
tes the encoder and activates the servo loop of each positioner of the XY group.
Next, performs a home search on the X positioner and configures the gantry mode used after homing.
Once the home search is finished with success, the group must be in “READY” state only if the Y positioner is already referenced. If it’s not the case, a home search on the Y positioner must be done.
To be “READY”, all axes must be referenced.

---

**NOTE**

The home search routine for each positioner is defined in the “stages.ini” file by the “HomeSearchSequenceType” key.
The home search time out is defined in the “stages.ini” file by the “HomeSearchTimeOut” key.

**Prototype**

```c
int InitializeAndHomeX(
    int SocketID,
    char * Option
)
```

**Input parameters**

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Option** char * Option selection(Option0, Option1 or Option2).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -25: Following Error.
- -28: Home search timeout.
- -33: Motion done timeout.
- -35: Position is outside of travel limits.
- -49: Inconsistent mechanical zero during home search.
- -113: Both ends of run activated.
- -200: Invalid socket.
- -202: Not allowed action due to an external motion interlock.
- -205: Not enable in your configuration.
- -208: Not allowed action because piston is engaged.
- -1004: Zygo signal is not present.
7.2.2.19 InitializeAndHomeXY

Name
InitializeAndHomeXY – Do home search on X then Y axis.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the set option: (-17)
- Verifies this command is allowed: (-22)
- Checks state of physical ends of run: (-113)
- Checks the opened socked is valid: (-200)
- Checks this command is enabled for the current controller configuration: (-205)

Description
This function initializes the motor, calibrates the encoder and activates the servo loop of each positioner of the XY group. Then, it performs a home search on X positioner and after on Y positioner. It configures the gantry mode used after homing.

Once the home search is finished with success, the group must be in “READY” state.

NOTE
The selected gantry option during the initialization phase is Option0.
The home search routine for each positioner is defined in the “stages.ini” file by the “HomeSearchSequenceType” key.
The home search time out is defined in the “stages.ini” file by the “HomeSearchTimeOut” key.
The home search sequence is defined in the “stages.ini” file by the “InitializationAndHomeSearchSequence”. The value must be “XthenY”.

Prototype
int InitializeAndHomeXY(
    int SocketID,
    char * Option
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Option char * Option selection(Option0, Option1 or Option2).

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -28: Home search timeout.
- -33: Motion done timeout.
- -35: Position is outside of travel limits.
- -44: Slave error disabling master.
- -49: Inconsistent mechanical zero during home search.
- -113: Both ends of run activated.
- -120: Warning following error during move with position compare enabled.
- -200: Invalid socket.
- -205: Not enable in your configuration.
7.2.2.20 **InitializeAndHomeY**

**Name**

InitializeAndHomeY – Do home search on Y axis.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies this command is allowed: (-22)
- Checks state of physical ends of run: (-113)
- Checks the opened socked is valid: (-200)
- Checks this command is enabled for the current controller configuration: (-205)

**Description**

This function initializes the motor, calibrates the encoder and activates the servo loop of each positioner of the XY group. Then, it performs a home search on the Y positioner. Once the home search is finished with success, the group must be in “READY” state only if the X positioner is already referenced. If it’s not the case, a home search on the X positioner must be done.

To be in “READY” state, all axes must be referenced.

---

**NOTE**

The home search routine for each positioner is defined in the “stages.ini” file by the “HomeSearchSequenceType” key.

The home search time out is defined in the “stages.ini” file by the “HomeSearchTimeOut” key.

---

**Prototype**

```c
int InitializeAndHomeY(
    int SocketID
)
```

**Input parameters**

- SocketID int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -22: Not allowed action.
- -25: Following Error.
- -28: Home search timeout.
- -33: Motion done timeout.
- 35: Position is outside of travel limits.
- -49: Inconsistent mechanical zero during home search.
- -113: Both ends of run activated.
- -200: Invalid socket.
- -202: Not allowed action due to an external motion interlock.
- -205: Not enable in your configuration.
- -208: Not allowed action because piston is engaged.
- -1004: Zygo signal is not present.
7.2.2.21 MoveAbsolute

**Name**

MoveAbsolute – Moves the stage to the end position. The positions are defined in um.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Invalid object type (group or positioner): (-8)
- Verifies target position in relation with the travel limits: (-17)
  - TargetPosition ≥ MinimumTargetPosition.
  - TargetPosition ≤ MaximumTargetPosition.
- Invalid positioner name: (-18)
- Invalid group name: (-19)
- Group status must be "READY" or “MOVING”: (-22)

**Description**

This function executes an absolute motion to go to a target XY position. The group state must be “READY” or “MOVING” else the (-22) error is returned. If the group is “READY” then the group status becomes “MOVING”.

Each “positioner” move refers to the acceleration, velocity, minimumTjerkTime and maximumTjerkTime as defined in the “Stages.ini” file or as redefined by the “PositionerSGammaParametersSet” function.

If a slave error or a following error is detected during the moving then (-25) or ERR_SLAVE (-44) error is returned. In this case, the motion in progress is stopped and the group status becomes “DISABLE”.

If a “MotionDoneMode” is defined as “VelocityAndPositionWindowMotionDone” then an (-33) error can be returned if the time out (defined by “MotionDoneTimeout” in the stages.ini file) is reached before the motion done.

If “AbortMove” or “GroupMoveAbort” is done, an (-27) error is returned. In this case, the motion in progress is stopped and the group status becomes “READY”.

If a “GroupKill” command, an emergency brake or an emergency stop is occurred, an (-26) error is returned. In this case, the motion in progress is stopped and the group status becomes “NOT INITIALIZED”.

**NOTE**

The asynchronous moves for positioners of the same group are possible through the use of different sockets to send the function.

**Prototype**

```c
int MoveAbsolute(
    int SocketID,
    double PositionAbsoluteX_um,
    double PositionAbsoluteY_um
)
```
**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
<tr>
<td>PositionAbsoluteX_μm</td>
<td>double</td>
<td>Target position in μm for X axis.</td>
</tr>
<tr>
<td>PositionAbsoluteY_μm</td>
<td>double</td>
<td>Target position in μm for Y axis.</td>
</tr>
</tbody>
</table>

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -25: Following Error.
- -26: Kill command or Emergency signal: check each positioners and each slave positioners, check that motion does not exceed software limits when combined with mapping and other features.
- -27: Move Aborted.
- -33: Motion done timeout.
- -44: Slave error disabling master.
- -120: Warning following error during move with position compare enabled.
7.2.2.22 MoveSlice

**Name**
MoveSlice – Executes a slice move on an XY group.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Verifies target position in relation with the travel limits: (-17)
- Checks the group status, it must be “READY” state: (-22)

**Description**
This API moves the stage to perform a “U-turn”.
The slice move begins a linear interpolation to move to (Xinter, Yend) but when the stage has finished the constant velocity phase, the slice move changes the target position to go to (Xend, Yend).

**Prototype**
int MoveSlice(
    int SocketID,
    double Yend_um,
    double Xend_um,
    double ScanAngle_urad
)

**Input parameters**
- SocketID (int): Socket identifier gets by the “TCP_ConnectToServer” function.
- Yend_um (double): Y target position in µm.
- Xend_um (double): X target position in µm.
- ScanAngle_urad (double): Scan angle in µrad.
Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -5: Not allowed due to a positioner error or hardware status.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -202: Not allowed action due to an external motion interlock.
- -208: Not allowed action because piston is engaged.
- -1004: Zygo signal is not present.
### 7.2.2.23 RequestType1

**Name**
RequestType1—Gets data collection Type 1.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function returns the data collection of type1.

**Prototype**

```c
int RequestType1(
    int SocketID,
    char * Header,
    charhex32 * TimeStamp,
    charhex32 * 1DFe,
    charhex32 * 1DPos,
    charhex32 * XFe,
    charhex32 * XPos,
    charhex32 * YawFe,
    charhex32 * YawPos,
    charhex32 * YFe,
    charhex32 * YPos,
    charhex32 * XMotor,
    charhex32 * YMotor,
    charhex32 * XSinCos,
    charhex32 * YSinCos
)
```

**Input parameters**

- **SocketID** int
  Socket identifier gets by the “TCP_ConnectToServer” function.
Output parameters

- **Header**: char * Type1, Type2 or Type3.
- **TimeStamp**: charhex32 * Internal counter in milliseconds.
- **1DFe**: charhex32 * 1D+ following error in µm.
- **1DPos**: charhex32 * 1D+ current position in µm.
- **XFe**: charhex32 * X following error in µm.
- **XPos**: charhex32 * Yaw following error in µm.
- **YawFe**: charhex32 * Yaw current position in µm.
- **YFe**: charhex32 * Y following error in µm.
- **YPos**: charhex32 * Y current position in µm.
- **XMotor**: charhex32 * X motor current in 1/10000 full scale.
- **YMotor**: charhex32 * Y motor current in 1/10000 full scale.
- **XSinCos**: charhex32 * X Sin Cos in Volts.
- **YSinCos**: charhex32 * Y Sin Cos in Volts.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-100**: Internal error (memory allocation error, …).
- **-136**: Wrong parameter type in the command string: charhex32 * expected.
7.2.2.24 RequestType2

**Name**
RequestType2– Gets data collection Type 2.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function returns the data collection of type2.

**Prototype**
```c
int RequestType2(
    int SocketID,
    char * Header,
    charhex32 * TimeStamp,
    charhex32 * ZygoLaserPower
)
```

**Input parameters**
- **SocketID** `int`: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- **Header** `char *`: Type1, Type2 or Type3.
- **TimeStamp** `charhex32 *`: Internal counter in milliseconds.
- **ZygoLaserPower** `charhex32 *`: Zygo Laser Power (ON = 1, OFF = 0).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-2**: TCP timeout.
- **-136**: Wrong parameter type in the command string: charhex32 * expected.
- **-205**: Not enable in your configuration.
- **-1000**: Zygo command execution failed.
- **-1001**: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.

[Note: The content is a direct transcription of the document, including typographical errors and formatting.]
7.2.2.25 **RequestType3**

**Name**
**RequestType3**— Gets data collection Type 3.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
This function returns the data collection of type3.

**Prototype**
```c
int RequestType3(
    int SocketID,
    char * Header,
    charhex32 * TimeStamp,
    charhex32 * ZygoSignalStrength1,
    charhex32 * ZygoSignalStrength2
)
```

**Input parameters**
- **SocketID**
  int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- **Header**
  char * Type1, Type2 or Type3.
- **TimeStamp**
  charhex32 *Internal counter in milliseconds.
- **ZygoSignalStrength1**
  charhex32 *Zygo Signal Strength 1.
- **ZygoSignalStrength2**
  charhex32 *Zygo Signal Strength 2.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -2: TCP timeout.
- -17: Parameter out of range or incorrect.
- -136: Wrong parameter type in the command string: charhex32 * expected.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.26 SetAccParams

Name
SetAccParams – Sets acceleration parameters for X and Y axes.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This API updates the current acceleration parameters for X and Y axes.
The smooth factor represents the jerk time and all parameters unit in milliseconds.

Prototype
```c
int SetAccParams(
    int SocketID,
    int XaccTime_ms,
    int XsmoothFactor_ms,
    int YaccTime_ms,
    int YsmoothFactor_ms
)
```

Input parameters
- **SocketID**
  int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **XaccTime_ms**
  int
  X acceleration time in msec.
- **XsmoothFactor_ms**
  int
  X Smooth factor in msec (jerk time).
- **YaccTime_ms**
  int
  Y acceleration time in msec.
- **YsmoothFactor_ms**
  int
  Y Smooth factor in msec (jerk time).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0:
  No error.
7.2.2.27 SetBrake

Name
SetBrake—Sets Brake command.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the break feature is enabled: (-205)

Description
This function sets brake command signal from Inhibit or GPIO connector.

Brake commands:
• 0 = Brake OFF
• 1 = Brake ON

Prototype
int SetBrake(
    int SocketID,
    int Command
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Command int Brake command (0 or 1).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -17: Parameter out of range or incorrect.
• -205: Not enable in your configuration.
7.2.2.28 **SetGantryMode**

**Name**

*SetGantryMode* – Sets Gantry mode (Option0, Option1 or Option2).

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the set option: (-17)
- Checks the group name is valid: (-19)
- Checks if XY gantry mode is enabled: (-205)

**Description**

Set the gantry option to use. It’s possible to configure the gantry mode only when the XY group is in “READY” or “DISABLE” state.

Three “gantry” options are available:

- Option0 = >Gantry standard.
- Option1 = >Gantry force balance.
- Option2 = >Gantry force balance with interferometer.

**Prototype**

```c
int SetGantryMode(
    int SocketID,
    char * Option
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.
- **Option** char *: Option selection(Option0, Option1 or Option2).

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -19: GroupName doesn’t exist or unknown command.
- -205: Not enable in your configuration.
7.2.2.29 SetJogAcceleration

**Name**

*SetJogAcceleration* – Changes the acceleration parameters in the jog mode.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group status must be “JOGGING”: (-22)

**Description**

This function allows changing the acceleration used by the jog mode. If an error occurs, each positioner stops and the velocity value is set to zero.

To use this function, the jog mode must be enabled (the call of ”StartJog” function is required). If the group status is not “JOGGING” then the (-22) error is returned.

If a slave error or a following error is detected during the jog setting then (-25) error or (-44) error is returned. In this case, the motion is stopped, the jog mode is disabled and the group status becomes “DISABLE”.

**Prototype**

```c
int SetJogAcceleration(int SocketID,
                        int XaccelerationTime_ms,
                        int XsmoothFactor_ms,
                        int YaccelerationTime_ms,
                        int YsmoothFactor_ms)
```

**Input parameters**

- **SocketAddress** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **XaccelerationTime_ms** int User jog Acceleration time for X in ms.
- **XsmoothFactor_ms** int User jog Smooth factor for X in ms.
- **YaccelerationTime_ms** int User jog Acceleration time for Y in ms.
- **YsmoothFactor_ms** int User jog Smooth factor for Y in ms.

**Output parameters**

None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Not allowed due to a positioner error or hardware status.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.30  SetJogVelocity

Name
SetJogVelocity – Changes “on the fly” the velocity in the jog mode.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group status must be “JOGGING”: (-22)

Description
This function allows changing “on the fly” the velocity used by the jog mode in the XY group. If an error occurs, each positioner stops and the velocity value is set to zero.
To use this function, the jog mode must be enabled (the call of the “StartJog” function is required). If the group status is not “JOGGING” then the (-22) error is returned.
If a slave error or a following error is detected during the jog setting then the (-25) error or (-44) error is returned. In this case, the motion is stopped, the jog mode is disabled and the group status becomes “DISABLE”.

NOTE
This function is available only for an XY group.

Prototype
int SetJogVelocity(
    int SocketID,
    double Xvelocity,
    double Yvelocity,
    int joystickAckTimeout_ms
)

Input parameters
SocketID    int          Socket identifier gets by the “TCP_ConnectToServer” function.
Xvelocity   double       user jog velocity for X in µm/s.
Yvelocity   double       user jog velocity for Y in µm/s.
joystickAckTimeout_ms int      user jog velocity acknowledge timeout in ms.

Output parameters
None.
Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Not allowed due to a positioner error or hardware status.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
### 7.2.2.31 SetPiston

#### Name

SetPiston – Sets command to engage or release piston.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if the brake feature is enabled: (-205)
- Check if try to release piston when Lift Pin is UP: (-202)

#### Description

Send command to engage or release piston.

**Piston commands:**
- 0 = Release Piston
- 1 = Engage Piston

#### Prototype

```c
int SetPiston(int SocketID, int Command)
```

#### Input parameters

- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Command** int Piston command (0 or 1).

#### Output parameters

None.

#### Return

(In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
  - -202: Not allowed action due to an external motion interlock.
- -205: Not enable in your configuration.
### 7.2.2.32 SetVarX

#### Name
SetVarX – Sets new value for a specified parameter name from stages.ini for X positioner.

#### Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

#### Description
Set new value for the specified parameter name from stages.ini file for the X positioner.

#### Prototype

```c
int SetVarX(
    int SocketID,
    char * ParameterName,
    double ParameterValue
)
```

#### Input parameters
- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **ParameterName**: char * Stages.ini parameter name.
- **ParameterValue**: double The value to be set for the “ParameterName”.

#### Output parameters
None.

#### Return
(In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-17**: Parameter out of range or incorrect.
- **-18**: Positioner Name doesn't exist or unknown command.
- **-22**: Not allowed action.
7.2.2.33 SetVarXSecondary

Name
SetVarXSecondary – Sets new value for a specified parameter name from stages.ini for X secondary positioner.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

Description
Set new value for the specified parameter name from stages.ini file for the X secondary positioner.

Prototype
int SetVarXSecondary(
    int SocketID,
    char * ParameterName,
    double ParameterValue
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
ParameterName char * Stages.ini parameter name.
ParameterValue double The value to be set for the “ParameterName”.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.34 **SetVarY**

**Name**
SetVarY – Sets new value for a specified parameter name from stages.ini for Y positioner.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter value: (-17)
- Checks positioner name: (-18)
- Verifies the positioner is from a XY group: (-22)

**Description**
Set new value for the specified parameter name from stages.ini file for the X secondary positioner.

**Prototype**
```c
int SetVarY(
    int SocketID,
    char * ParameterName,
    double ParameterValue
)
```

**Input parameters**
- **SocketID**
  int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **ParameterName**
  char *
  Stages.ini parameter name.
- **ParameterValue**
  double
  The value to be set for the “ParameterName”.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -18: Positioner Name doesn't exist or unknown command.
- -22: Not allowed action.
7.2.2.35  **SetVelParams**

**Name**
SetVelParams – Sets acceleration parameters for X and Y axes.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

**Description**
This API updates the current velocity parameters in µm/s for X and Y axes.

**Prototype**
```c
int SetAccParams(
    int SocketID,
    double Xvelocity,
    double Yvelocity
)
```

**Input parameters**
- **SocketID**
  int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Xvelocity**
  double X velocity in µm/s.
- **Yvelocity**
  double Y velocity in µm/s.

**Output parameters**
None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.2.36 **SetXVelParams**

**Name**
SetXVelParams – Sets velocity for X axis.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

**Description**
This API updates the velocity parameter in µm/s for X axis.

**Prototype**
```c
int SetXVelParams(
    int SocketID,
    double Xvelocity
)
```

**Input parameters**
- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Xvelocity**: double X velocity in µm/s.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -8: Wrong object type for this command.
7.2.2.37 SetYVelParams

Name
SetYVelParams – Sets velocity for Y axis.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks motion profile: (-8)

Description
This API updates the velocity parameter in µm/s for Y axis.

Prototype
int SetYVelParams ( 
    int SocketID,
    double Yvelocity
)

Input parameters
SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.
Yvelocity double Y velocity in µm/s.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
7.2.2.38 **SetZone**

**Name**
SetZone – Sets parameters to define the circle zone.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the positioner name is valid: (-18)
- Not allowed due to configuration disabled: (-121)
- Not allowed because group is not initialized or not referenced: (-135)

**Description**
Set parameters to define a circle zone.
An output signal will be generated when the position is inside the circle.
The digital output is defined in the stage.ini file.
It's always available after the home search.
All parameters are defined in μm.
The Radius and Hysteresis are defined to signal when going out the circle.

**Prototype**

```c
int SetZone(int SocketID, double x_center_um, double y_center_um, double radius_um, double hysteresis_um)
```

**Input parameters**

- **SocketID**: int
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **x_center_um**: double
  X center in μm.
- **y_center_um**: double
  Y center in μm.
- **radius_um**: double
  Radius in μm.
- **hysteresis_um**: double
  Hysteresis in μm.

**Output parameters**
None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- **0**: No error.
- **-18**: PositionerName doesn't exist or unknown command.
- **-121**: Not allowed due to configuration disabled.
- **-135**: Not allowed because group is not initialized or not referenced.
7.2.2.39 **StartJog**

**Name**

StartJog – Enables the jog mode in XY group.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks the positioner name: (-18)
- Checks the group name: (-19)
- Group status must be “READY”: (-22)
- Backlash must be not activated: (-46)

**Description**

This function enables the Jog mode for the first declared XY group. To use this function, the group must be in the “READY” state and all positioners must be idle (means velocity must be 0).

This function allows going to the “JOGGING” state. If the group state is not “READY”, the (-22) error is returned.

---

**NOTE**

Use the “EndJog” function to disable the jog mode.

---

**Prototype**

```c
int GetJogAcceleration(
    int SocketID
)
```

**Input parameters**

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0: No error.
- -8: Wrong object type for this command.
- -18: Not allowed due to a positioner error or hardware status.
- -19: GroupName doesn't exist or unknown command.
- -22: Not allowed action.
- -46: Not allowed action due to backlash.
7.2.2.40 WaitMotionEnd

Name
WaitMotionEnd – Wait the end of move (XY group only).

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Group must be “XY”: (-8)
- Checks expected position after motion: (-211)

Description
This function allows waiting the real end of move (after a GroupMoveAbsolute, GroupMoveRelative or GroupMoveSlice).

NOTE
This function is available only for an XY group.

Prototype
int WaitMotionEnd(
    int SocketID,
    char * GroupName,
    double TimeOutMs,
    double YPosition,
    double XPosition
);

Input parameters
SocketID
int Socket identifier gets by the “TCP_ConnectToServer” function.

GroupName
char * XY Group name.

TimeOutMs
double Time out in milliseconds.

YPosition
double Y position to check in microns.

XPosition
double X position to check in microns.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -17: Parameter out of range or incorrect.
- -22: Not allowed action.
- -211: Not expected position after motion.
7.2.2.41 ZygoADCDiagnosticStatusGet

**Name**
ZygoADCDiagnosticStatusGet – Gets the diagnostic ADC status.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Axis number and Zygo axis number: (-17)

**Description**
Returns the diagnostic ADC status in relation to the ADC Mux number.

**Prototype**

```c
int ZygoADCDiagnosticStatusGet(
    int SocketID,
    int Axis,
    int ADCMuxNumber,
    char * ADCDiagStatus
);
```

**Input parameters**
- **SocketID** (int): Socket identifier gets by the “TCP_ConnectToServer” function.
- **Axis** (int): Zygo axis number (1 or 2).
- **ADCMuxNumber** (int): ADC Mux (refer to table 4-12 from ZMI2402 manual).

**Output parameters**
- **ADCDiagStatus** (char *): Raw value from Diag ADC Register.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0**: No error.
- **-2**: TCP timeout.
- **-17**: Parameter out of range or incorrect.
- **-1000**: Zygo command execution failed.
- **-1001**: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.42  ZygoAmplitudeGet

**Name**
ZygoAmplitudeGet – Gets the reference channel status and measuring channel amplitude.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**
Returns the reference channel status and the measuring channel amplitudes.

**Prototype**
```c
int ZygoAmplitudeGet(
    int SocketID,
    int * ZygoReferenceSignalStatus,
    int * Meas1Signal,
    int * Meas2Signal
)
```

**Input parameters**
- SocketID  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**
- EthernetCommunicationStatus  int *  
  1 = Connected, 0 = Not connected.
- Meas1Signal  int *  
  Measure 1 Signal Strength (refer to ZMI 2402 Diagnostic ADC).
- Meas2Signal  int *  
  Measure 2 Signal Strength (refer to ZMI 2402 Diagnostic ADC).

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0:  
  No error.
- -1001:  
  The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
### 7.2.2.43 ZygoConnectToServer

#### Name

ZygoConnectToServer – Connect ZYGO to server.

#### Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)
- Checks Zygo is enabled: (-205)

#### Description

This function opens a TCP/IP communication with a ZMI Measuring board.

#### Prototype

```c
int ZygoConnectToServer(
    int SocketID
)
```

#### Input parameters

- **SocketID**: int
  - Socket identifier gets by the “TCP_ConnectToServer” function.

#### Output parameters

None.

#### Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-8**: Wrong object type for this command.
- **-205**: Not enable in your configuration.
- **-1002**: Connection to Zygo TCP server failed.
- **-1003**: The XPS controller is already connected to Zygo TCP server.
7.2.2.44  **ZygoDisconnectFromServer**

**Name**

**ZygoDisconnectFromServer** – Disconnect ZYGO from server.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Close the TCP/IP communication opened with the ZYGO ZMI box.

**Prototype**

```c
int ZygoDisconnectFromServer(  
    int SocketID  
)
```

**Input parameters**

SocketID  

| int  

Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  

  No error.
7.2.2.45 ZygoErrorStatusGet

Name

ZygoErrorStatusGet – Gets the ZYGO error status code via Ethernet.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo axis value: (-17)
- Checks Zygo is enabled: (-205)

Description

This function returns the ZYGO axis error code.

The axis error codes are listed in the “Zygo error status list”.

The description of the axis error code can be getting with the “ZygoErrorStatusStringGet” function.

Prototype

int ZygoErrorStatusGet(
    int SocketID,
    int Axis,
    char * ErrorStatus
)

Input parameters

SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Axis int ZMI Axis number (1 = Y axis and 2 = X axis).

Output parameters

ErrorStatus char * ZMI Axis Error Status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -2: TCP timeout.
- -17: Parameter out of range or incorrect.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.46 **ZygErrorStatusStringGet**

**Name**

*ZygErrorStatusStringGet* – Gets the ZYGO axis error status description via Ethernet.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zyg axis value: (-17)

**Description**

This function returns the ZYGO axis error status description.

**Prototype**

```c
int ZygErrorStatusStringGet(
    int SocketID,
    int Axis,
    char * ErrorStatusDescription
)
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Axis**: int ZMI Axis number (1 = Y axis and 2 = X axis).

**Output parameters**

- **ErrorStatusDescription**: char * ZMI Axis Error Status description.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-17**: Parameter out of range or incorrect.
7.2.2.47  

**ZygoEthernetCommunicationStatusGet**

**Name**

*ZygoEthernetCommunicationStatusGet* – Gets ZYGO Ethernet Connection Status.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Get the Ethernet Communication Status: Connected or Not connected.

**Prototype**

```c
int ZygoEthernetCommunicationStatusGet(
    int SocketID,
    int * EthernetCommunicationStatus
)
```

**Input parameters**

SocketID  
int  
Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

EthernetCommunicationStatus  
int *  
1 = Connected, 0 = Not connected.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  
  No error.
7.2.2.48  **ZygoGetPEGLastCommunicationTime**

**Name**

*ZygoGetPEGLastCommunicationTime* – Gets the last communication time to configure Zygo PEG.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the XPS controller configuration: (-4)

**Description**

This function gets the last communication time to configure Zygo PEG in seconds.

**Prototype**

```c
int ZygoGetPEGLastCommunicationTime(
    int SocketID,
    double * LastCommunicationTime,
)
```

**Input parameters**

- **SocketID**  
  int  
  Socket identifier gets by the TCP_ConnectToServer function.

- **ParamName**  
  double *  
  Last communication time to configure PEG (s).

**Output parameters**

None.

**Return** (In addition to the results of “**Input Tests Common to all XPS Functions**”)

- 0:  
  No error.

- -4:  
  Unknown command.
7.2.2.49  **ZygoGetVerInterfero**

**Name**

**ZygoGetVerInterfero** – Gets firmware version of ZMI system (ZYGO interferometer) via Ethernet.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo is enabled: (-205)

**Description**

This function returns the ZMI system name and its firmware version number.

**Prototype**

```c
int ZygoGetVerInterfero(
    int SocketID,
    char * Version
)
```

**Input parameters**

- **SocketID** int: Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

- **Version** char *: ZMI system version.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-2**: TCP timeout.
- **-205**: Not enable in your configuration.
- **-1000**: Zygo command execution failed.
- **-1001**: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.50 **ZygoInterferometerStatusGet**

**Name**

`ZygoInterferometerStatusGet` – Gets ZYGO interferometer status.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Get ZYGO interferometer status:

- Ethernet connection status.
- Axis #1 signal status.
- Axis #2 signal status.
- Reference signal status.
- P2 Board status.

**Prototype**

```c
int ZygoInterferometerStatusGet(
    int SocketID,
    int * EthernetCommunicationStatus,
    int * ZygoAxis1MeasureSignal,
    int * ZygoAxis2MeasureSignal,
    int * ZygoReferenceSignalStatus,
    int * ZygoP2BoardStatus
)
```

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SocketID</td>
<td>int</td>
<td>Socket identifier gets by the “TCP_ConnectToServer” function.</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EthernetCommunicationStatus</td>
<td>int</td>
<td><code>1</code> = Connected, <code>0</code> = Not connected.</td>
</tr>
<tr>
<td>ZygoAxis1MeasureSignal</td>
<td>int</td>
<td><code>1</code> = Axis #1 signal present, <code>0</code> = No signal.</td>
</tr>
<tr>
<td>ZygoAxis2MeasureSignal</td>
<td>int</td>
<td><code>1</code> = Axis #2 signal present, <code>0</code> = No signal.</td>
</tr>
<tr>
<td>ZygoReferenceSignalStatus</td>
<td>int</td>
<td><code>1</code> = Reference signal present, <code>0</code> = No Signal.</td>
</tr>
<tr>
<td>ZygoP2BoardStatus</td>
<td>int</td>
<td><code>1</code> = P2 board ready, <code>0</code> = P2 board not ready or not present.</td>
</tr>
</tbody>
</table>

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
7.2.2.51 ZygoPositionGet

Name
ZygoPositionGet – Gets positions of Y and X axes from ZMI system via Ethernet.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo is enabled: (-205)

Description
This function returns positions (36-bits) of Y and X axes.

Prototype
int ZygoPositionGet(
    int SocketID,
    long long int * PositionY,
    long long int * PositionX
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
PositionY long long int * Current position of Y axis.
PositionX long long int * Current position of X axis.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -2: TCP timeout.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.

•
7.2.2.52 **ZygoReadLong**

**Name**

*ZygoReadLong* – Read a long register from a ZMI Measuring board.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function reads a LONG register (max 32-bits) from a ZMI Measuring board.

**Example**

*Read Control Register 1 on Axis 1:*

*ZygoReadLong (AXIS1, A)*

ZMI Measuring board Response:

#H70

**Prototype**

```c
int ZygoReadLong(
    int SocketID,
    char * AxisNum,
    char * Register,
    char * Response
)
```

**Input parameters**

**SocketID**

int

Socket identifier gets by the “TCP_ConnectToServer” function.

**AxisNum**

c char *

“AXIS1” or “AXIS2”.

**Register**

c char *

Register value in hexadecimal.

**Output parameters**

**Response**

c char *

Response returned by the ZMI Measuring board.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-2:** TCP timeout.
- **-1000:** Zygo command execution failed.
- **-1001:** The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.53 ZygoReadWord

Name
ZygoReadWord – Read a long register from a ZMI Measuring board.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

Description
This function reads a WORD register data (max 16-bits) from a ZMI Measuring board.

Example
Read Control Register 1 on Axis 2:
ZygoReadWord (AXIS2, A)
ZMI Measuring board Response:
#H1

Prototype
int ZygoReadWord(
    int SocketID,
    char * AxisNum,
    char * Register,
    char * Response
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
AxisNum char * “AXIS1” or “AXIS2”.
Register char * Register value in hexadecimal.

Output parameters
Response char * Response returned by the ZMI Measuring board.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -2: TCP timeout.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.

Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.54  **ZygoRegisterGet**

**Name**
ZygoRegisterGet – Gets register value from P2 ZYGO board.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)

**Description**
This function reads the register value from P2 ZYGO board.  
Refer to the list of P2 interface registers.

**Prototype**
```c
int ZygoRegisterGet(
    int SocketID,
    char * PositionerName,
    int Register,
    int * Value
)
```

**Input parameters**
- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **PositionerName**  
  char *  
  Positioner name.
- **Register**  
  int  
  Register value in hexadecimal.

**Output parameters**
- **Value**  
  int *  
  Response returned by the ZMI Measuring board.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0:** No error.
- **-8:** Wrong object type for this command.
7.2.2.55  ZygoRegisterSet

Name
ZygoRegisterSet – Sets register value from P2 ZYGO board.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks the object type of this command is valid: (-8)

Description
This function sets the register value from P2 ZYGO board.
Refer to the list of P2 interface registers.

Prototype
int ZygoRegisterSet(
    int SocketID,
    char * PositionerName,
    int Register,
    int Value
)

Input parameters
SocketID          int     Socket identifier gets by the “TCP_ConnectToServer” function.
PositionerName    char *  Positioner name.
Register          int     Register value in hexadecimal.
Value             int     Response returned by the ZMI Measuring board.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
• 0: No error.
• -8: Wrong object type for this command.
7.2.2.56  *ZygoReset*

**Name**

*ZygoReset* – Reset all Zygo axes.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks if Zygo mode is enabled: (-205)
- Checks Zygo TCP Server Connexion: (-1001)

**Description**

This function sends commands to Zygo ZMI 2402 to reset all Zygo axes (#1 and #2).

**Prototype**

```c
int ZygoReset(
    int SocketID
)
```

**Input parameters**

SocketID  int  Socket identifier gets by the “TCP_ConnectToServer” function.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -205:  Not enable in your configuration.
- -1001:  The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.57 ZygoResetX

Name
ZygoResetX – Reset X axis via Ethernet.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo is enabled: (-205)

Description
This function resets X axis (defined as Zygo axis #2).
The Axis Reset resets only the measurement function and error conditions, and does not affect axis configuration. An axis reset is identical to the combined effects of the Position Reset, Time Reset, and Error Reset.
The Position Reset reinitializes the position measurement function and sets the position register to zero.
The Time Reset immediately sets the time register to zero.
The Error Reset resets all errors.

NOTE
Due to minor timing differences, simultaneous multi-axis reset commands may result in some axes actually being reset one reference clock period (50 ns) later than other axes.

The allowable operating conditions and the time required for an axis reset depends on the settings in Aux Control 0 as shown below.
The reset time is from the Reset Axis command until Position Reset Complete status.
This time includes the Reset Delay (RD) specified in Control Register 2. Table 3-8 specifies the Reset Delay choices.

Prototype
int ZygoResetX(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the
            “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -2: TCP timeout.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.58  ZygoResetY

Name
ZygoResetY – Reset Y axis via Ethernet.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo is enabled: (-205)

Description
This function resets Y axis (defined as Zygo axis #1).
The Axis Reset resets only the measurement function and error conditions, and does not affect axis configuration. An axis reset is identical to the combined effects of the Position Reset, Time Reset, and Error Reset.
The Position Reset reinitializes the position measurement function and sets the position register to zero.
The Time Reset immediately sets the time register to zero.
The Error Reset resets all errors.

NOTE
Due to minor timing differences, simultaneous multi-axis reset commands may result in some axes actually being reset one reference clock period (50 ns) later than other axes.

The allowable operating conditions and the time required for an axis reset depends on the settings in Aux Control 0 as shown below.

<table>
<thead>
<tr>
<th>Enable Reset</th>

Prototype
int ZygoResetY(
    int SocketID
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -2: TCP timeout.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.59 ZygoSendAndReceive

**Name**

ZygoSendAndReceive – Send a command and read a response from ZYGO box.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

Send a command to ZYGO box and wait a response from ZYGO box.

The command string must be defined in the ZYGO format.

**Prototype**

```c
int ZygoSendAndReceive(
    int SocketID,
    char * Command,
    char * Response
)
```

**Input parameters**

- **SocketID**
  - **Type**: int
  - **Description**: Socket identifier gets by the “TCP_ConnectToServer” function.

- **Command**
  - **Type**: char *
  - **Description**: “AXIS1” or “AXIS2”.

- **Register**
  - **Type**: char *
  - **Description**: Command to send to ZYGO box.

**Output parameters**

- **Response**
  - **Type**: char *
  - **Description**: Response read from ZYGO box.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0**: No error.
- **-2**: TCP timeout.
- **-1000**: Zygo command execution failed.
- **-1001**: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.

---

**Note:**

This document is a programming manual for the XPS Unified System, focusing on the ZygoSendAndReceive function for sending commands to ZYGO boxes and receiving responses. The function requires a socket identifier, a command string, and a register string. The input and output parameters are specified, and the return values include standard error codes as well as Zygo-specific error codes. The manual provides guidance on how to use this function effectively within the XPS Unified System environment.
7.2.2.60  *ZygoSetOffsetX*

**Name**

*ZygoSetOffsetX* – Sets offset value for X axis via Ethernet.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter type: (-127)
- Checks Zygo is enabled: (-205)

**Description**

This function sets the offset value for X (defined as Zygo axis #2). The offset value is subtracted from the position value.

**Prototype**

```c
int ZygoSetOffsetX(
    int SocketID,
    long Xoffset
);
```

**Input parameters**

- **SocketID**: int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Xoffset**: long Offset value for X.

**Output parameters**

None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -2: TCP timeout.
- -127: Wrong parameter type in the command string: long or long * expected.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.61 **ZygoSetOffsetY**

**Name**
ZygoSetOffsetY – Sets offset value for Y axis via Ethernet.

**Input tests**
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter type: (-127)
- Checks Zygo is enabled: (-205)

**Description**
This function sets the offset value for Y (defined as Zygo axis #1). The offset value is subtracted from the position value.

**Prototype**
```c
int ZygoSetOffsetY(  
    int SocketID,  
    long Yoffset  
)
```

**Input parameters**
- **SocketID** int Socket identifier gets by the “TCP_ConnectToServer” function.
- **Yoffset** long Offset value for Y.

**Output parameters**
None.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
- **0:** No error.
- **-2:** TCP timeout.
- **-127:** Wrong parameter type in the command string: long or long * expected.
- **-205:** Not enable in your configuration.
- **-1000:** Zygo command execution failed.
- **-1001:** The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.62  **ZygoSetPEGParams**

**Name**

ZygoSetPEGParams – Sets PEG parameters (ZYGO System) via Ethernet.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameter type: (-127)
- Checks Zygo is enabled: (-205)

**Description**

This function sets PEG (Position Event Generator) parameters.

The PEG function generates an electronic signal when the internal position measurement meets criteria established by values programmed into the board by the host system.

The first pulse is output when the position value enters the active region between the P1 and P2 values.

Additional pulses are output each time the position changes by the prescribed Delta 1, or in Delta 2 mode

For K1 number of PEG events, the increment value is Delta 1
For K2 number of PEG events, the increment value is Delta 2

This repeats K1, K2, K1, K2, etc…

Pulses stop when the position leaves the active region between the P1 and P2 values.

This may be repeated for travel in either direction between P1 and P2.

A number of other features, such as signal polarity, axis select (for 2402), and pulse duration shall be programmable. Direction of motion is inferred by the position crossing the start and stop values. Starting operation at a point in between the start and stop values is undefined.

When entering at P1, the PEG starts with Delta 1. When entering at P2, the Delta is selectable by the **PEG P2 Delta** bit in the PEG Control register (refer to PEG Control register).
NOTE
This API is enabled only with a ZMI system equipped of PEG function.
Refer to ZYGO ZMI 2400 with PEG Function (revision J).

Prototype
int ZygoSetPEGParams(
    int SocketID,
    long P1,
    long P2,
    unsigned int Delta1,
    long K1,
    unsigned int Delta2,
    long K2,
    int ControlWord
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
P1 long Start PEG region (+/- 660 mm).
P2 long End PEG region (+/- 660 mm and P2 > P1).
Delta1 unsigned int Increment value (max 20 µm).
K1 long Number of PEG events.
Delta2 unsigned int Increment value (max 20 µm).
K2 long Number of PEG events.
ControlWord int PEG control (refer to PEG Control register).

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

• 0: No error.
• -2: TCP timeout.
• -127: Wrong parameter type in the command string: long or long * expected.
• -205: Not enable in your configuration.
• -1000: Zygo command execution failed.
• -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.63 ZygoStartBoardP2

Name
ZygoStartBoardP2 – Starts ZYGO P2 board.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks input parameters value: (-17)

Description
This function allows initializing and starting the ZYGO P2 board.

Required settings to get the board up and running after power up:

Switch Settings
SW6-3:4  Set to ON ON for INT0 to deliver Axis 1 interrupts
SW6-5:6  Set to OFF ON for INT1 to deliver Axis 2 interrupts
SW6-7:8  Set to OFF OFF for sampling on SCLK1 falling edge
SW8-1:8  Set all to ON for a 00000000 base P2 address (recommendation)
This will correspond to required A11:4 on the P2 pins.
- Switch settings can be found on 2-9 in the manual.

Register Settings
Control Register 1  Set the desired P2_RESET * line behavior (bits 6:3)
Bit 8 (P2 latch Mode) = 0, External sample input
Bit 9 (P2 D16 Select) = 0, for 32-bit data path
- The above must be done for both axes.
Bit 10 (P2 Scclk0 Disable) = 1
Bit 11 (P2 Scclk0 Output Enable) = 1
- The above must be done for axis 1 only.
Control Register 2  Set the desired Kp digital filter (bits 6:4)
the desired Kv digital filter values, (bits 2:0)
- See section of ZMI manual for more information
Set the Change Position Direction Sense bit. This bit defines the interferometer direction.
Setting this bit reverses the direction sense of the position accumulator. An axis reset must be performed after changing the direction sense.
- All of the above must be done for both axes.
Data Age Adjust Program the appropriate data age adjust values
See detailed procedure below for more information
- This must be done for both axes.
P2 Interrupt Enable  Select which errors will generate a signal on the P2_INT *
- This must be done for both axes.

Procedural Steps
Read the status register until Reference Present bit is present in the Status Register. This indicates that the laser is locked. Check the Measure Present bit on each axis; when this bit is active, perform an axis reset for that axis. Ensure Error Status Register is cleared.
Position information should now be continuously updated, as long as there are no Fatal Errors.
Prototype
int ZygoStartBoardP2(
    int SocketID,
    int Kv,
    int Kp,
    bool ReverseDirectionSense,
    int DataAgeAdjust
)

Input parameters
SocketID int Socket identifier gets by the “TCP_ConnectToServer” function.
Kv int digital filter Kv gain = -7, -9, -11, -13, -15, -17, -19 or -32.
Kp int digital filter Kp gain = -2, -3, -4, -5, -6, -7, -8 or -9.
ReverseDirectionSense bool true = reversed direction, false = normal direction.
DataAge Adjust int Data Age Adjust Register.

Output parameters
None.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -17: Parameter out of range or incorrect.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
7.2.2.64  *ZygoStartInterferometer*

**Name**  
*ZygoStartInterferometer* – Start ZYGO interferometer.

**Input tests**  
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**  
Start ZYGO interferometer: Open Ethernet connection, Check signals, Start P2 Board  
This API can take several minutes.

**Prototype**  
```c
int ZygoADCDiagnosticStatusGet(
    int SocketID,
    int Axis,
    int ADCMuxNumber,
    char * ADCDiagStat
)
```

**Input parameters**  
- **SocketID**  
  int  
  Socket identifier gets by the “TCP_ConnectToServer” function.
- **Axis**  
  int  
  Zygo axis number (1 or 2).
- **ADCMuxNumber**  
  int  
  ADC Mux (refer to table 4-12 from ZMI2402 manual).

**Output parameters**  
- **ADCDiagStatus**  
  char *  
  Raw value from Diag ADC Register.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)
  
- **0:**  
  No error.
- **-2:**  
  TCP timeout.
- **-17:**  
  Parameter out of range or incorrect.
- **-205:**  
  Not enable in your configuration.
- **-1000:**  
  Zygo command execution failed.
- **-1001:**  
  The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- **-1002:**  
  Connection to Zygo TCP server failed.
- **-1003:**  
  The XPS controller is already connected to Zygo TCP server.
- **-1004:**  
  Zygo signal is not present.
7.2.2.65 ZygoStatusGet

Name
ZygoStatusGet – Gets the ZYGO axis status code via Ethernet.

Input tests
- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo axis value: (-17)
- Checks Zygo is enabled: (-205)

Description
This function returns the ZYGO axis status code.
The axis status codes are listed in the “Zygo axis status list”.
The description of the axis status code can be getting with the “ZygoStatusStringGet” function.

Prototype
int ZygoErrorStatusGet(
    int SocketID,
    int Axis, char * Status
)

Input parameters
SocketID int Socket identifier gets by the
“TCP_ConnectToServer” function.
Axis int ZMI Axis number (1 = Y axis and 2 = X axis).

Output parameters
Status char * ZMI Axis Status.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)
- 0: No error.
- -2: TCP timeout.
- -17: Parameter out of range or incorrect.
- -205: Not enable in your configuration.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.
7.2.2.66  ZygoStatusStringGet

Name

ZygoStatusStringGet – Gets the ZYGO axis status description via Ethernet.

Input tests

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.
- Checks Zygo axis value: (-17)

Description

This function returns the ZYGO axis status description.

Prototype

int ZygoStatusStringGet(
    int SocketID,
    int Axis,
    char * StatusDescription
  )

Input parameters

SocketID     int     Socket identifier gets by the “TCP_ConnectToServer” function.
Axis         int     ZMI Axis number (1 = Y axis and 2 = X axis).

Output parameters

StatusDescription char *  ZMI Axis Status description.

Return (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0:  No error.
- -17: Parameter out of range or incorrect.
7.2.2.67 **ZygoWriteLong**

**Name**

**ZygoWriteLong** – Write data to a long register of ZMI Measuring board.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function write data to a long register (max 32-bits) of ZMI Measuring board.

**Example**

Write 0x5000 to Control Register 1 on Axis 1:

```c
ZygoWriteLong(AXIS1, A, 5000)
```

**ZMI Measuring board Response:**

```
OK
```

**Prototype**

```c
int ZygoWriteLong(  
    int SocketID,  
    char * AxisNum,  
    char * Register,  
    char * Data,  
    char * Response  
)
```

**Input parameters**

- **SocketID**
  - *int* Socket identifier gets by the “TCP_ConnectToServer” function.
- **AxisNum**
  - *char* “AXIS1” or “AXIS2”.
- **Register**
  - *char* Register value in hexadecimal.
- **Data**
  - *char* Data value in hexadecimal in max-32bits.

**Output parameters**

- **Response**
  - *char* Response returned by the ZMI Measuring board.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- **0:** No error.
- **-2:** TCP timeout.
- **-1000:** Zygo command execution failed.
- **-1001:** The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”. 
7.2.2.68  ZygoWriteWord

**Name**

ZygoWriteWord – Write data to a word register of ZMI Measuring board.

**Input tests**

- Refer to section 7.1: “Input Tests Common to all XPS Functions”.

**Description**

This function changes a word register data (max 16-bits) to a ZMI Measuring board.

**Example**

*Write 0x0020 to Control Register 1 on Axis 1:*

ZygoWriteWord(AXIS1, A, 20)

*ZMI Measuring board Response:*

OK

**Prototype**

```c
int ZygoWriteWord(
    int SocketID,
    char * AxisNum,
    char * Register,
    char * Data,
    char * Response
)
```

**Input parameters**

- **SocketID**: int – Socket identifier gets by the “TCP_ConnectToServer” function.
- **AxisNum**: char * – “AXIS1” or “AXIS2”.
- **Register**: char * – Register value in hexadecimal.
- **Data**: char * – Data value in hexadecimal in max-16bits.

**Output parameters**

- **Response**: char * – Response returned by the ZMI Measuring board.

**Return** (In addition to the results of “Input Tests Common to all XPS Functions”)

- 0: No error.
- -2: TCP timeout.
- -1000: Zygo command execution failed.
- -1001: The controller is not connected to Zygo TCP server. Run ZygoStartInterferometer API.
- Zygo errors: Refer to section 8.9: “Error List”.

---

**NOTE**

Positioner errors are used to trigger consequences on the system, for instance disable, emergency break, etc. Positioner hardware status information is mainly provided for information purposes.

**Positioner hardware status description:**

*General inhibition detected:* This refers to the General Inhibition connector at the rear panel or the Stop All button at the front panel of the XPS controller. The General Inhibition connector is a safety feature and can be used for a custom STOP ALL emergency switch. Inhibition (pin#2), must always be connected to GND during normal operation of the controller. In this case, inhibition is not detected. An open circuit is equivalent to pressing STOP ALL on the front panel, in which case, inhibition is detected.

*ZM high level:* This refers to the mechanical zero signal used with some stages. The ZM signal is high during one part of the travel and low during the other part of the travel. The detection of the ZM high/low transition in combination with an encoder index pulse signal allows a fast and repeatable origin search (MechanicalZeroAndIndexHomeSearch).

*Minus end of run activated:* Refers to the hardware minus end of run limit switch. During normal operation, this end of run switch should never be activated and any motion will be stopped by the detection of the minus software limit.

*Plus end of run activated:* Refers to the hardware positive end of run limit switch. During normal operation, this end of run switch should never be activated and any motion will be stopped by the detection of the positive software limit.
Minus end of run glitch: Undesirable, momentary instability of the hardware minus end of run signal, for instance can be generated by ripple or noise.

Plus end of run glitch: Undesirable, momentary instability of the hardware positive end of run signal, for instance can be generated by ripple or noise.

Encoder quadrature error: Error generated when the signals of both encoder channels simultaneously change. In normal operation, only one quadrature signal changes state at a time. This error can occur due to an undesirable level change or a glitch as illustrated below.

Encoder freq. and coherency error: Error generated when the frequency of the signals is too high. The maximum frequency of the encoder input is 25MHz.

Hard interpolator encoder error: Error generated when the difference of the sine/cosine encoder signals from a unity circle is too large (for instance when signals are phase shifted or amplitude modified).

Hard interpolator quad. encoder error: Error generated when the signals of both encoder channels of the hardware interpolated encoder output simultaneously change. Same error as Encoder quadrature error except that the quadrature signals are those converted from the sine/cosine signals of the hard interpolator. The hardware interpolator is used only with AnalogInterpolated encoders to trigger the position compare output and to gather positions during external data gathering.

First driver in fault: problem with the first driver.

Second driver in fault: problem with the second driver in case two drivers are connected to one axis.

First driver powered on: First driver with motor ON after initialization.

Second driver powered on: Second driver with motor ON after initialization, in case two drivers are connected to one axis.

| CONTROLLER_STATUS_INTERFERO_INITIALIZATION_FAILED                                   | 0x00000080      | Zygo interferometer Ethernet initialisation failed                                            |
| CONTROLLER_STATUS_INTERFERO_ERROR_STATUS                                           | 0x00000100      | Zygo interferometer error detected. Please check ZYGO Error Status                           |
| CONTROLLER_STATUS_MOTION_VELOCITY_LIMITED                                           | 0x00000200      | Motion velocity is limited                                                                     |
| CONTROLLER_STATUS_LIFT_PIN_UP                                                      | 0x00000400      | Lift pin is UP                                                                                 |

**NOTE**

Within about 5 minutes after the controller startup, due to the hardware thermal stabilization, the CONTROLLER_STATUS_CORRECTOR_OVER_CALCULATED, CONTROLLER_STATUS_CORRECTOR_INTERRUPT_LOST, CONTROLLER_STATUS_PROFILER_OVER_CALCULATED, CONTROLLER_STATUS_CPU_OVERLOAD or CONTROLLER_STATUS_NB_OPENED_SOCKETS_REACHED_MAXIMUM_ALLOWED status flags may be raised.

These flags are automatically reset after a controller status reading using the ControllerStatusGet() command.

Another way to avoid these flags during the 5 first minutes after boot is to set the following parameter in system.ref to 300 (seconds):

DelayBeforeStartup = 300 ; Controller boots completely after 300 seconds
## 8.11 “ExternalInterlockA” error list

9.0 Process Examples

This section provides examples of programming sequences. The next diagrams show the order of use of the different Functions. To see programming code examples, please refer to the TCL Manual for TCL scripts.

9.1 Management of Errors Example

When an error occurs, it is desirable to analyze and fix the error. The following error display and socket closing procedure is useful to detect and display the errors during the execution of a program. This sequence could be added to each program and called each time users need to test certain parts of a program.

Display error and close procedure:
9.2 Firmware Version Example

- Open TCP connection
- TCPOpen error?
- Display TCP connection failed
- Get firmware version
- FirmwareVersionGet error?
- Display error and close procedure
- Display XPS controller version
- Close TCP socket
- TCPClose error?
- Display TCP close failed
- Display TCP socket closed
9.3 Gathering with Motion Example

Open TCP connection

- Display TCP connection failed
- YES
- NO

- TCPOpen error?
- YES
- NO

- Kill group
- YES
- NO

- Display error and close procedure
- YES
- NO

- GroupKill error?
- YES
- NO

- Initialize group
- YES
- NO

- Display error and close procedure
- YES
- NO

- GroupInitialize error?
- YES
- NO

- Home group
- YES
- NO

- Display error and close procedure
- YES
- NO

- GroupHomeSearch error?
- YES
- NO

- Configure gathering
- YES
- NO

- Display error and close procedure
- YES
- NO

- GatheringConfigurationSet error?
- YES
- NO

- Add event SGamma.MotionStart with action GatheringRun
- YES
- NO

- Display error and close procedure
- YES
- NO

- EventAdd error?
- YES
- NO

- Event occurred

- Move positioner
- YES
- NO

- Display error and close procedure
- YES
- NO

- GroupMoveRelative error?
Close TCP socket

Display TCP close failed

GatheringStopAndSave

Display error and close procedure

Stop gathering and save

TCP close error?

NO

YES

Display TCP socket closed

NO

Display TCP socket closed
9.4 External Gathering Example

Open TCP connection

- Display TCP connection failed
  - YES
  - NO: Terminate TCP connection error?

- Kill group
  - YES: Display error and close procedure
  - NO

- Initialize group
  - YES: Display error and close procedure
  - NO

- Home group
  - YES: Display error and close procedure
  - NO

- Configure external gathering
  - YES: Display error and close procedure
  - NO

- Add event Immediate with action ExternalGatheringRun
  - YES: Display error and close procedure
  - NO

- Wait end of external gathering
  - YES
  - NO: Get current number realized
Close TCP socket

Display TCP close failed

GatheringExternalCurrentNumberG

YES

NO

Display error and close

Display TCP socket closed

GatheringExternalStopAndSave

YES

NO

Close TCP

Stop external gathering and save

Display error and close

TCPClose

YES

NO
9.5 Position Output Compare Example

Open TCP connection

Display TCP connection failed

Yes

TCOpen error?

No

Kill group

Display error and close procedure

Yes

Group Kill error?

No

Initialize group

Display error and close procedure

Yes

Group Initialize error?

No

Home group

Display error and close procedure

Yes

Group Home Search error?

No

Move positioner

Display error and close procedure

Yes

Group Move Absolute error?

No

Set position compare parameters

Display error and close procedure

Yes

Positioner Position Compare Set error?

No

Enable position compare mode

Display error and close procedure

Yes

Positioner Position Compare Enable error?

No
Move

- GroupMoveRelative error?
  - YES Display error and close
  - NO Disable position compare

- Display error and close
  - YES PositionerPositionCompareDisable error?
    - YES Display error and close
    - NO Close TCP

- Close TCP
  - Display TCP close failed
    - YES Display TCP socket
    - NO
9.6 Slave-Master Mode Example

- Open TCP connection
  - TCPOpen error?
    - YES
      - Display TCP connection failed
      - Kill group
      - Display error and close procedure
      - GroupKill error?
        - YES
          - Display error and close procedure
        - NO
          - Initialize group
          - Display error and close procedure
          - GroupInitialize error?
            - YES
              - Display error and close procedure
            - NO

                          - Move master positioner
Close TCP socket failed

Display error and close

YES

GroupMoveRelative error?

NO

Disable slave-master

Display error and close

YES

8SingleAxisSlaveModeDisable error?

NO

Close TCP

Display TCP close failed

YES

TCP Close error?

NO

Display TCP socket closed
9.7 Jogging Example

Open TCP connection

Display TCP connection failed

NO

TCPOpen error?

YES

Kill group

Display error and close procedure

GroupKill error?

NO

Initialize group

Display error and close procedure

GroupInitialize error?

NO

Home group

Display error and close procedure

GroupHomeSearch error?

NO

Enable jog mode

Display error and close procedure

GroupJogModeEnable error?

NO

Set jog parameters to move a positioner

Display error and close procedure

GroupJogParametersSet error?

NO

Set jog parameters to stop a positioner
Display error and close

GroupJogParametersSet error?

YES

Disable jog mode

Display error and close

GroupJogModeDisable error?

YES

Close TCP

Display TCP close failed

TCPClose error?

YES

Display TCP socket closed

NO
9.8 Tracking Example

Open TCP

YES TCPOpen error?

NO

Kill

YES GroupKill error?

NO

Initialize

YES GroupInitialize error?

NO

Display error and close

Home

YES GroupHomeSearch error?

NO

Display error and close

Set tracking

YES PositionerAnalogTrackingPositionParameters Set?

NO

Enable tracking

YES GroupAnalogTrackingModeEnable

NO

Change the amplitude of analog

Display error and close

Disable tracking

YES GroupAnalogTrackingModeDisable

NO

Close TCP

YES TCPClose error?

NO

Display TCP close failed

Display TCP socket
9.9 Backlash

Open TCP connection

YES

TCPOpen error?

NO

Kill group

YES

GroupKill error?

NO

Enable Backlash

YES

PositionerBacklashEnable error?

NO

Initialize group

YES

GroupInitialize error?

NO

Home group

YES

GroupHomeSearch error?

NO

Modify Backlash value

YES

PositionerBacklash Set error?

NO

Move in positive direction

## 9.10 Timer Event and Global Variables

Open TCP connection 1

Display TCP connection failed

YES

TCPOpen error?

NO

Calculate divisor

Configure timer

Display error and close procedure

YES

TimerSet error?

NO

Add event Timer with action ExecuteTCLScript

Display error and close procedure

YES

EventAdd error?

NO

Set global variable

Display error and close procedure

YES

GlobalArraySet error?

NO

Close TCP socket 1

Display TCP close failed

YES

TCPClose error?

NO

Display TCP socket 1 closed
Event occurred

Open TCP connection

Display TCP connection

YES

Open connection error?

TCPOpen error?

YES

Display TCP connection failed

NO

Read global

Display error and close

YES

GlobalArrayGet error?

Value<END error?

YES

Increment global

NO

GlobalArraySet error?

Delete timer

YES

Set global

NO

Delete timer error?

Display error and close

EVENT OCCURED

Increment global

Set global

GlobalArrayGet error?

GlobalArraySet error?

NO

Display TCP close error?

Display TCP close

NO

TCPClose error?

Display TCP socket closed

Display TCP socket 2

Close TCP socket

Display TCP close

NO
9.11 Running Several Motion Processes Simultaneously

The groups must be initialized and homed before executing these processes.
Add event MotionEnd with action

- If out == 1?
  - YES Display error and close
  - NO Change value of global

- If change of value of global variable?
  - YES Increment
  - NO

Display error and close procedure

- EventAdd error?
  - YES Display error and close
  - NO Move positioner to

- GroupMoveAbsolute?
  - YES Display error and close
  - NO Move positioner to -

- GroupMoveAbsolute?
  - YES Display error and close
  - NO

- Get GPIO digital

- GPIODigitalGet error?
  - YES Display error and close
  - NO

- Get value of global

- GlobalArrayGet error?
  - YES Display error and close
  - NO

- If counter == 10?
  - YES Display error and close
  - NO

Will stop the loop of the TCL script on socket 2

- GlobalArraySet error?
  - YES Display error and close
  - NO

- Close TCP

- TCPClose error?
  - YES Display error and close
  - NO
